# Preface

# **Purpose of this book**

This Getting Results book provides you with information on how to install and navigate **RS**Logix 5000. The guide includes troubleshooting information and tips on how to use **RS**Logix 5000 effectively. It also explains how to access and navigate the online help.

## **Intended** audience

We assume that you are familiar with:

- IBM-compliant personal computers
- Microsoft Windows NT, version 4.0 with Service Pack 4.0
- Allen-Bradley Company's Logix5550 controller

# How does it fit in with other Rockwell Software product documentation?

The Getting Results book can be considered the entry point into our documentation set. The documentation set contains pertinent, easily accessible product information and ships with the software product. The documentation set is designed to free you from tedious paper shuffling and reduce information overload.

The Getting Results book, online help, and the Online Books option make up the RSI documentation set.

## **Online help**

The online help includes all overview, procedural, screen, and reference information for the product. The help contains four basic components: overview topics, quick start topics, step-by-step procedures, and screen element descriptions (for example, text boxes, drop-down lists, and option buttons).

#### **Online Books**

For our more complex products, we provide you with online documentation that you can elect to install when you install the RSLogix 5000 software. This documentation includes all reference guides (such as programmer's guides and code reference guides) in an electronic format that you can access from the Help menu. Using the Online Books option allows you to get instant access to the information you need.

## **Document conventions**

The conventions used throughout this document for the user interface comply with those recommended by Microsoft. If you are not familiar with the Microsoft Windows user interface, we recommend that you read the documentation supplied with the operating system you are using before attempting to use this software.

## Feedback

Please use the feedback form, which you will find packaged with your software, to report errors and/or let us know what information you would like to see added in future editions of this document.

Chapter

# Getting started with RSLogix 5000

# Introduction

This chapter includes the following information:

- Welcome to **RS**Logix 5000<sup>TM</sup>
- Quick Start steps
- Navigating the software

# Welcome to RSLogix 5000

With the RSLogix 5000 Logix programming software package, you need only one programming software for sequential, process, drive, and motion control programming. The RSLogix 5000 software package provides you both symbolic programming with structures and arrays for increased productivity, and an instruction set that serves all of these types of applications.

RSLogix 5000 is designed to work with Rockwell Automation's Logix Platforms and the Logix5000 family of controllers. RSLogix 5000 functionality includes:

- ease of configuration, including a graphical controller organizer, I/O configuration dialogs, a motion configuration tool, and point-and-click methods of configuration
- sophisticated data handling, using both arrays and user-defined structures, to
  provide the flexibility necessary for the application rather than forcing it to fit
  the particular memory structure as defined by the controller's data table
  memory
- easy-to-use I/O addressing methods

Getting started with RSLogix 5000 • 1

- a free-form ladder editor that allows you to modify multiple rungs of logic simultaneously, as well as to enter logic either from the point-and-click interface or via an ASCII entry prompt
- a flexible, easy-to-use function block diagram editor that allows you to program your logic via function blocks
- drag-and-drop editing and navigation to quickly move data elements from one data file to another, rungs from one subroutine or project to another, or instructions from rung to rung or function block diagram to function block diagram within a project
- an instruction set that includes motion, relay ladder, and function block instructions
- logical application organization, using task, program, and routine structures
- diagnostic monitoring capability, including a status display of the current controller state, a program verification feature, and a robust data monitor
- highly integrated motion support

# **Exploring RSLogix 5000**

To navigate through the various windows and toolbars in RSLogix 5000 more easily, you should understand what they contain and what functionality each provides.

When you open a project in RSLogix 5000, you can expect to see:

- The Menu bar Select functionality from the menus that appear as you click each selection on this bar.
- The Create Component toolbar Use this toolbar to create new project components (e.g., tags, routines, programs, etc.).
- The Online bar This toolbar displays program and controller status. This toolbar indicates the operational mode as well as whether there are edits present.
- The Common Logic toolbar This toolbar contains all ladder logic items that are not instructions (e.g., rungs, branches), as well as the most commonly used instructions.
- The Standard toolbar This toolbar contains many functions, (e.g., cut, copy, paste) that you will use repeatedly as you develop and test your logic program.

- The Ladder Edit toolbar This toolbar contains all of the online editing functions, as well as some common editing functions.
- The Tabbed Instruction toolbar This toolbar displays instruction mnemonics in tabbed categories. When you click on a category tab, the instruction toolbar just above it changes to show that category of instructions. Click on an instruction to insert it in your ladder program.
- The status bar Look at the status bar for ongoing status information or prompts as you use the software.
- The Controller Organizer The Controller Organizer is a graphical representation of the contents of your controller project.
- The View pane The main window of the RSLogix 5000 software provides you with a framework in which you can view various editors (e.g., the Ladder Editor, Tag Editor, Data Type Editor, etc.).

You can increase the amount of space you have for editor windows by hiding the Controller Organizer (**View > Controller Organizer** or Alt + 0) and the Results window (**View > Results** or Alt + 1).

 The Results window - The Results window appears at the bottom of the main RSLogix 5000 window after you have performed an operation that yields multiple results or errors. This window provides you with error and status information on an operation as it executes.

This window consists of two tabs:

- The Error Tab If you perform an operation that results in an error, the error is highlighted in the Results window.
- The Search Tab When you use the Find All and Replace All functions, the find and replace results are written to the Search tab.

# **Quick Start steps**

The following steps explain how to get up and running quickly with RSLogix 5000 as soon as you install it.

#### Step 1 Create a Project

RSLogix 5000 is based on projects, which are complete sets of files associated with your controller's programming and configuration. Follow these steps to create a new project.

1. From the File menu, choose New.

The New Controller dialog appears.

Vendor:	Allen-Bradley	
<u>T</u> ype:	1756-L1 ControlLogix 5550 Controller	ОК
Na <u>m</u> e:	[	Cancel
Description:	2	<u>H</u> elp
<u>C</u> hassis Type:	1756-A10 10-Slot ControlLogix Chassis	1
Sl <u>o</u> t;	0 - <u>R</u> evision: 6 6 -	3
Create In:	C:\RSLogix 5000\Projects	Browse

- **2.** From the Type pull-down menu, choose the controller type that you wish to use for this project.
- 3. Enter the name you wish to use for the new project.

The name you enter here will be used to create the project file; the .acd extension will automatically be appended to this name (i.e., you do not need to enter it).

4. Enter a description of the controller.

Getting started with RSLogix 5000 • 5

5. Choose the appropriate chassis type in which the controller will reside.

**Note:** This field is disabled if you have chosen a FlexLogix controller type. FlexLogix does not have a physical chassis, and therefore you do not need to select a chassis type.

6. Enter the slot number for this controller.

In ControlLogix, controllers occupy a numbered slot in the chassis and can be placed in any slots. It is also possible to place multiple controllers in the same chassis.

For FlexLogix, since there is no physical chassis, this field is disabled, and slot number 0 is displayed.

7. Enter the appropriate revision information for your controller.

This field defaults to the latest revision for the given controller type. For FlexLogix, this field is disabled.

8. Enter the directory in which you want to store the project file.

The directory defaults to the one you configured in the Workstation Options dialog. If you want to use a different directory, type its path or click on the Browse button to find the directory.

The project file is created in this directory with the same name as the controller, with a .ACD file extension. For example, if your controller name is Oven1, the project file name will be Oven1.ACD.

9. Click on OK to create the project.

Once the project file is created, you will see the Controller Organizer, which shows everything in the controller.

The default configuration contains a continuous task, called MainTask. The Main Task contains a program called MainProgram. The Main Program contains a routine called MainRoutine, which is configured as the main routine.

In addition, if you have chosen a FlexLogix controller, two FlexBus 1794 virtual backplane adapters are created in slots 3 and 4 under the I/O Configuration folder. These two folders will contain all local I/O for FlexLogix, other than the two local slots for communication. The first folder contains all the I/O configured on the local Flex rail housing the Flex controller; the second folder contains all I/O configured for the local non-controller rail.

#### Step 2 Configure the Controller

Follow these steps to configure the controller. For this Quick Start, most of the default settings will be useful for you.

1. From the Edit menu, choose Controller Properties.

The Controller Properties dialog appears, with the General tab selected.

o, Controller Pro	perties - te	st			_ 🗆 ×
Serial Port Proto General	ocol N Dat	1ajor Faults e/Time	Minor Faults Communicatio	Advanced	File Serial Port
Vendor: A Type: 1 C	· Allen-Bradley 756-L1 ControlLogix5	550 Programm	able Controller		
<u>N</u> ame:	test				
Description:				×	
Sl <u>o</u> t Number:	0 -				
Chassis Type:	1756-A10A 1	0-Slot Chassis	•		
Revision:	1				
		ОК	Cancel	Apply	Help

This dialog contains the information you provided in the New Controller dialog. You can make any changes you wish to the general controller properties here, or proceed to Step 2.

**2.** Click on the Date/Time tab to configure the controller's wall clock time and the coordinated system time status.

Note: You can only configure the wall clock time while you are online.

3. Click on the Serial Port tab to configure the controller's serial port.

Getting started with RSLogix 5000 • 7

**4.** Click on the System Protocol tab to configure the controller's serial port for DF1 Point to Point, DF1 Master, or DF1 Slave.

Select the protocol you would like to use from the drop-down list. Configure other parameters on this tab according to the protocol you choose.

**5.** Click on the Advanced tab to configure advanced controller properties such as system fault program, power-up handler program, and system overhead time slice.

If you are online, you can also view controller memory usage statistics from this tab.

6. Click on the File tab to view information about the project file.

**Note:** This tab is informational only; you cannot edit any of the attributes shown here.

**7.** Click on the OK button to accept your configuration and close the Controller Properties dialog.

#### Step 3 Create and Configure I/O

Follow these steps to create and configure inputs and outputs. In RSLogix 5000, you must manually add all I/O and Communications modules.

**1.** Right click on the I/O Configuration Folder in the Controller Organizer, and choose New Module.

[ype:	Major <u>R</u> evision:
1756-CNB/A	
Туре	Description
1756-CNB/A	1756 ControlNet Bridge
1756-CNB/B	1756 ControlNet Bridge
1756-CNB/D	1756 ControlNet Bridge
1756-CNBR/A	1756 ControlNet Bridge, Redundant Media
1756-CNBR/B	1756 ControlNet Bridge, Redundant Media
1756-CNBR/D	1756 ControlNet Bridge, Redundant Media

Show	
Vendor: All	💌 🔽 Other 🔽 Specialty I/O 💦 Select All
🔽 Analog 🔽 [	jigital IV Communication IV Motion IV ProcessorClear All

The Select Module Type dialog appears.

**2.** Choose the module type you want to create and click on OK.

The Create Module wizard leads you through a series of dialogs from which you can complete the process of creating and configuring the I/O module.

**3.** Enter the configuration information for the module you are creating. You must enter the name of the module and the current slot number where the module resides. **4.** Click the Finish button when you're done entering information in the Create wizard.

## Step 4 Enter Tags and Aliases

Follow these steps to enter tags and aliases.

**1.** Right click on the Controller Tags folder in the Controller Organizer and choose Edit Tags.

The Tag Editor appears. At this point, the Editor will be empty, since you have not created any tags yet.

<u>@</u>	Program Tag	s - Mai	inProgra	m			_ 🗆 ×
Se	co <u>p</u> e: MainPro	ogram	-	Show: Show Al	•	Sort: Tag Name	• •
	Tag Name	$\nabla$	Alias For	Base Tag	Туре	Style	Description
*							
							-
4	Monitor T	ags λ	Edit Tag	s /	1		

- **2.** In the create tag row, indicated by an asterisk (\*), enter the name of the tag in the Tag Name column.
- **3.** Enter a description of the tag, if desired.
- 4. To create a base tag, enter the tag data type.
- 5. To create an alias tag, enter the tag to which the new tag refers.

- **6.** Select the scope for the tag from the pull-down menu, if desired. All tags are controller scoped by default.
- **7.** Select the style in which you want to display the value of the tag (e.g., Hex, Binary, etc.).

Based on the data type you selected, a default style is chosen automatically.

#### 8. Press Enter.

This moves the current cell to the next row, which creates a new tag. If there is any error in your tag definition, you will be prompted.

P

If you have already defined the I/O modules, RSLogix 5000 automatically added tags for these modules. All I/O tags are controller scoped.

The background color of a cell indicates whether the cell is read only or not. A white background indicates that the cell is modifiable; gray indicates that the cell is read only.

#### **Step 5** • Enter Ladder Logic

Follow these steps to enter the ladder logic you will use to define your programs and routines.

 Right click on the Main Routine icon in the Controller Organizer and choose Open.

The RSLogix 5000 software opens the Ladder Editor Routine window. If the ladder routine is empty, RSLogix 5000 automatically adds the first rung.

- **2.** From the Ladder Instruction toolbar, click on the tab corresponding to the instruction group from which you want to add an instruction.
- Select the desired instruction and drag it into the ladder editor routine view.
   The instruction is added to the rung or branch on which you chose to put it.
- **4.** Modify the instruction as necessary..

Use the Tag Browser to define the corresponding tag.

- **5.** Use the Ladder Instruction toolbar to add additional rungs, branches, branch levels, or instructions as required by your routine.
- 6. Right mouse click on the routine tab and choose Verify Routine.

Any errors in your rung will be sent to the Results window .

- 7. Make the necessary modifications to your rung.
- 8. Right mouse click and choose Accept Pending Rung Edit.

**Note:** This is only required if you are online. You do not need to do this when you are offline unless you have a pending rung edit you created while online.

If you are online, the Accept Pending Rung Edit command transfers the rung to the controller, but does not execute it if you are in Run mode. Any errors in your rung are sent to the Results window.

#### Step 6 Download

Follow these steps to download your project to the controller.

**1.** From the Communications menu, choose Who Active.

The Who Active dialog appears, from which you can select a communications path to the controller. If RSLinx is not already running, it is launched so that you can view the network topology.

- **2.** Select the controller from the tree.
- **3.** Click on the Recent button to navigate to the Select Recent Communications Path dialog, from which you can choose a communications path from among the most recent paths stored on this workstation.
- **4.** Click on Download.

You are prompted to confirm that you wish to complete the download procedure. Since you have already configured your communications path, the download works immediately, and your project is downloaded to the controller. Download status and compiler messages appear in the status bar.

TIP The controller must be in Program or Remote Program mode before you can download the project.

#### Step 7 Monitor Tags

Follow these steps to monitor your tags and the values you have assigned to them.

- **1.** Switch the controller to Run mode.
- Double click on the Controller Tags folder in the Controller Organizer. The data monitor appears, and provides you with a means for viewing the values assigned to specific tags. This includes the status of your I/O modules.

1	Controller Tag	s - LocalAl	C(controller)			_ 🗆 ×
S	cope: LocalAC(	controller)	Show: Show	All	💌 So <u>r</u> t: Tag N	ame 💌

You can view:

- Tag Name (read only)
- Value
- Force Mask
- Style
- Type (read only)
- Description

The background color of a cell indicates whether the cell is read only or not. A white background indicates that the cell is modifiable; gray indicates that the cell is read only.

#### Step 8 Monitor Logic

Follow these steps to monitor your ladder logic as the controller executes your routines.

- **1.** Switch the controller to Run mode.
- 2. Double-click on the main routine to open the ladder editor.

You can view your ladder logic. The rungs glow and values change as the controller executes your routine.

## **System Requirements**

To use RSLogix 5000 software effectively, your personal computer must meet the following hardware and software requirements.

#### **Hardware Requirements**

The personal computer must have at least:

- a Pentium 90 MHz processor
- a minimum of 32 Mb RAM (we recommend 64 Mb)
- 40 Mb hard disk space free
- any Windows-compatible pointing device

#### **Software Requirements**

You must have installed these software products:

- The operating system must be Microsoft® Windows NT® 4.0, with Service Pack 5. (RSLogix 5000 software does not support Windows NT 3.51, Windows NT 3.50, Windows 95, nor Windows 3.x operating systems.)
- RSLinx communication software must be installed on the same computer on which the RSLogix 5000 software will be installed. Refer to the Release Notes in the RSLogix 5000 online help for specific software version information, as well as for compatibility information for various hardware and software revisions.

#### Chapter

# Installing RSLogix 5000

# Introduction

After becoming familiar with the basic concepts of **RS**Logix 5000 software, you are ready to install and start **RS**Logix 5000 software.

This chapter explains how to install RSLogix 5000 software

TIP P	After installing the <b>RS</b> Logix 5000 software, we recommend that you read the <b>RS</b> Logix 5000 release notes located in the online help. The release notes may contain more up-to-date information than was available when this document was printed. To view the release notes, start <b>RS</b> Logix 5000 software; then, click <b>Help &gt; Release Notes</b> .
TIP 💡	When installing <b>RS</b> Logix 5000 software on a Windows NT 4.0 operating system, you must have Windows NT system administrator privileges. If you do not have these privileges, contact your system administrator.

# Installation

The **RS**Logix 5000 software package includes the **RS**Logix 5000 installation program on CD-ROM. Follow the instructions in this chapter to install the software that you purchased.

## Before you install RSLogix 5000

Keep the following considerations in mind before you install the **RS**Logix 5000 software:

- Be certain that no other copies of RSLogix 5000 are currently running, and be sure to always uninstall earlier versions of the software.
- Be certain that RSLinx is installed before installing RSLogix 5000, and make sure that you have only one copy of DTL32.DLL on your system

- You must have Administrator privileges for Windows NT V4.0 on the machine on which you are installing **RS**Logix 5000. You do not need these privileges to use the software once it is installed, but you will not be able to complete the installation without them.
- We strongly recommend that you close all other applications before you install RSLogix 5000.

#### Installing RSLogix 5000 software

The following section describes installing **RS**Logix 5000 software on the Windows NT operating system.

- **1.** Start the PC.
- 2. Start Windows NT 4.0, if it does not start automatically.
- 3. Insert the **RS**Logix 5000 installation CD into your CD-ROM drive.

The CD-ROM should autostart. If it does not, run ausetup.exe from the root of the CD.

**4.** Select Install RSLogix 5000.

During installation, if you already have a version of RSLogix 5000 installed on your computer, you will be prompted to give the installation program permission to uninstall the older version (if you have not already done so).

5. Follow the directions that appear on your screen.

When prompted for a serial number, enter any sequence of characters, not longer than 10 characters in length. Press F1 if you need help.

- **6.** When prompted, click Yes to complete the activation of the software. Follow the directions that appear on your screen.
- **7.** Click on Finish to complete the installation.

When the setup utility finishes, an entry for the **RS**Logix 5000 application program appears in the program list in the Rockwell Software group.

**8.** Remove the CD of the **RS**Logix 5000 installation from the CD-ROM drive and store it in a safe place.

# Starting RSLogix 5000 software

To start **RS**Logix 5000 software on a PC that uses the Windows NT 4.0 operating system, click Start and then select **Programs > Rockwell Software > RSLogix** 5000 > **RSLogix 5000** from the menu.

**TIP** Remember to use the Help function from within the application if you need help with a specific dialog or function. Press [F1] or click the Help button on a dialog, or select Help from the menu bar.

# **Troubleshooting installation**

If **RS**Logix 5000 does not start up or run properly, keep the following in mind:

- Do you have the correct version of **RS**Linx software installed? **RS**Linx software provides communication between the controller and your personal computer. **RS**Logix 5000 requires **RS**Linx version 2.10 or later.
- Does your computer have enough memory? Running RSLogix 5000 on Microsoft Window NT 4.0 requires a minimum of 32 Mb of RAM.

Then:

Is the activation key installed?

#### **Troubleshooting Hints**

#### lf:

You see this message at the

"Uninstall completed. Some elements could not be removed. You should manually remove items related to the application."

end of a manual uninstallation:

1. Manually delete the target directory with the remaining files.

2. Remove the registry entries related to the shared DLL with the registry editor. For information about using the registry editor, see the help file.

**Warning:** Using the registry editor incorrectly can cause serious problems including reinstallation of Windows. Use the registry editor at your own risk.

The registry values that remain look like the following:

C:\Program Files\Rockwell Software\RSLogix 5000\Bin\1756\_DO\_PG\_1.dll

The registry values can be found under the following registry key:

HKEY\_LOCAL\_MACHINE\SOFTWARE\Microsoft\ Windows\CurrentVersion\SharedDLLs The installation or uninstallation failed for any reason, and cannot be restarted 1. Using the registry editor, manually remove the following keys in the Registry:

HKEY\_LOCAL\_MACHINE\SOFTWARE\Microsoft\ Windows\CurrentVersion\Uninstall\RS5000.exe

HKEY\_LOCAL\_MACHINE\SOFTWARE\Microsoft\ Windows\CurrentVersion\AppPaths\RS5000.exe

HKEY\_LOCAL\_MACHINE\SOFTWARE\Rockwell Software\RSLogix 5000

For information about using the registry editor, see the help file.

**Warning:** Using the registry editor incorrectly can cause serious problems including reinstallation of Windows. Use the registry editor at your own risk.

2. Remove the target directory that was chosen during the previous successful installation (if any).

Chapter

# Advanced configuration concepts

# **Consolidated controller view**

The **RS**Logix 5000 Controller Organizer uses the standard tree dialog interface to display the many components that make up the Logix5550 controller. This graphical display illustrates the hierarchical relationship between tasks, programs, and routines within a controller, as well as the I/O and network modules that make up the control system. This display consists of folders and their contents that contain all of the information about the programs and data in the current project.

In front of each folder, there is an icon containing a + sign or a - sign. The + sign indicates that the folder is closed. Click on it to expand the tree display and display the contents of the folder. The - sign indicates that the folder is already open and its contents are visible.

Click the right mouse button to bring up many different, context-sensitive popup menus. Often, you will find that this is a shortcut to using menu options from the menu bar. Double-click on files in the Controller Organizer display to bring up functional dialogs, from which you can enter parameters to accomplish relevant tasks.

### I/O configuration dialogs

**RS**Logix 5000 software makes use of an I/O configuration wizard that walks you through the process of configuring the highly functional ControlLogix modules. Once configured, the I/O dialogs provide you with access to runtime diagnostic information.

#### Motion configuration

**RS**Logix 5000 provides both logic programming and motion support. Motion configuration wizards help you to configure your axes. Motion support also includes a built-in auto-tune function to reduce the overall setup time normally required to configure a motion system.

#### **Communications configuration**

**RS**Linx provides communications to the Logix5550 controller to provide program download, program upload, online editing, and data-monitoring functionality. Any of the ControlLogix network modules or the RS232 interface on the front of the controller provide local or remote access.

The current communications configuration is the configuration for the controller to which you would like to connect. The name of the RSLinx driver you select is shown on the Online Toolbar. You can configure the current communications configuration by choosing **Communications > Who Active** to access the Who Active dialog. If you then click on Go Online, Upload, or Download and click on Apply, you will save the selected communications path as the current path. If you want to save the current path to an open project file, check the Apply to Current Project box, click on Apply, and then click on Cancel to close the Who Active dialog.

When you open a project, the communications configuration stored with the project becomes the current configuration. If you create a project, the current communications configuration will be stored with the project. You will usually want to change the configuration before downloading to a controller. Use Who Active dialog to change the configuration.

Chapter

# Advanced application organization concepts

# Introduction

The Controller Organizer uses the model of the tree structure to show you the interrelationships of the data and programs within your controller.

Important components to be aware of are:

- tasks
- programs
- routines

## **Task properties**

Tasks can be scheduled, edited, and controlled. Each task can contain multiple programs, status information, and configuration information.

The Logix5550 controller supports 32 separate tasks. One task, the Main Task, is always continuous; the other 31 tasks are periodic. When you create a project, the Main Task is already defined as a continuous task.

Once you create a task, there are other properties that you must configure, such as how the programs within the task execute. You can prioritize the tasks up to 15 levels:

- the continuous task has the lowest priority
- a task at a higher priority (i.e., lower priority number) pre-empts one at a lower priority (i.e., higher priority number)
- tasks at the same priority execute on a time-slice basis at 1 ms intervals

Once you create a task, you can later change its descriptive information if you wish.

#### **Program properties**

Each program contains a local data area (referred to as program tags), main executable routine, subroutines, and a fault routine. The controller supports up to 32 programs. The programs within a task execute from first to last.

When you create a project, the Main Program is already defined in the Main Task.

Once you create a program, you must then configure the main routine and, optionally, a fault routine. You can later change the program's descriptive information if you wish.

## **Routine properties**

A routine is similar to a program file in the PLC-5 or SLC processor. Each program must have a main routine configured. You can also specify a fault routine and additional subroutines. You can have as many routines per program as the controller memory allows.

When you create a project, the Main Routine is already defined in the Main Program.

Once you create a routine, you can later change its descriptive information.

Chapter

# Advanced data handling concepts

#### Introduction

In the past, you developed your applications in such a way as to fit them within the confines of your programmable controller's data table. The introduction of **RS**Logix 5000 and the Logix5550 controller eliminates this restriction by providing both arrays and user-defined structures. This allows the data to be constructed to meet the needs of your applications rather than forcing your applications to fit a particular memory structure.

# Using symbolic programming

With **RS**Logix 5000, you can use symbolic tag names (up to 40 characters in length) to assign data within a controller. This functionality allows you to name your data specifically for its function within the control program, while providing self-documented logic.

Tag names can begin with an upper or lowercase letter (a through z), or an underscore (\_) character. The remaining 39 characters can contain numbers (0 through 9), letters, or the underscore.

#### **Data tag aliasing**

You can create symbolic tag names to access individual pieces of data or to point to another tag. This allows you to take advantage of and reuse engineering methods by creating logic using one set of tag names and then, at installation time, pointing these tags to the actual I/O tags. This allows you flexibility in designing your programs, as well as allowing you to separate the electrical design and program development processes.

You can automatically display the base tag of an alias tag by doing the following:

From the Tools menu, choose Options to display the Workstation Options dialog. From there, click on the Ladder Display tab and check Show Tag Alias Information.

#### Storage of symbolic names on the controller

All of the tag names you use are downloaded with the control program into the Logix5550's memory. These tag names are then used at runtime to provide access to the controller's data. Consequently, you no longer need to worry about the physical location of data within the controller. When the controller is uploaded, all of the tag names are retrieved to provide a partially-documented program.

## **User-defined structures**

**RS**Logix 5000 provides the ability to create custom-defined structures to store and handle data as a group. These structures supplement the predefined structures (e.g., Timers, Counters, PID, Message, etc.). A user-defined structure can contain any base data type (e.g., SINT, INT, DINT, BOOL, REAL) or structure (either predefined or user-defined). In addition, a single-dimensional array can be included as a structure member.

To create a user-defined structure, right click on the User-Defined folder in the Controller Organizer, and choose New Data Type. The Data Type editor will appear, from which you can define your new data type.

## **Three-dimensional arrays**

Many control programs require the ability to store blocks of information in tables that can be traversed at runtime. **RS**Logix 5000 supports this requirement by providing the ability to create custom arrays with up to three separate dimensions (i.e., row, column, and depth). Individual cells within an array may contain any base data type (e.g., SINT, INT, DINT, BOOL, REAL) or structure (either predefined or user-defined).

# **Program/controller data scoping**

Traditionally, the data within a controller is scoped in such a way that all routines have access to read and modify its contents. This can hinder the creation of library routines because of the collisions that can occur when two programs are placed in the same application.

**RS**Logix 5000 solves this problem by providing both program and controller data encapsulation. Data created global to the controller is accessible by all logic within a controller, much the same way that a data table was accessible in previous PLC processors. The program local data, however, is accessible only to the routines within a single program. The same tag name may appear in different programs as local variables.

You can specify which scope you wish to view by selecting the scope from the drop-down menu in the Tag Editor and/or Data Monitor.

# System-shared data (produced/consumed tags)

Data can be shared between controllers via scheduled peer-to-peer connections. When you design your application, you configure it to both produce global to other controllers in the system via the backplane, or consume tags from other controllers. This allows you to be selective about which data is sent and received by any controller. Likewise, multiple controllers can connect to any data being produced, thereby preventing the need to send multiple messages containing the same data.

# I/O addressing methods

Addressing I/O information with the **RS**Logix 5000 and Logix5550 controller eliminates the confusion often associated with typical programmable controller systems. Once you configure an I/O module, using the I/O Configuration wizard, tags are created using a combination of the communications node name, physical chassis slot number, I for input, O for output, and Data to reference the data to and from an I/O module.

All of the module's information, both data and status, is presented as a structure with individual field names for each component. This eliminates the struggle associated with trying to figure out which bit, or byte represents which piece of information coming from the module. Using tag aliasing, real names can be tied to any portion of an I/O tag, enabling you to document how the information is used.

• Getting Results with **RS**Logix 5000

Chapter

# Advanced ladder editing and function block concepts

# Introduction

This chapter provides information that you can use to make editing your ladder logic easier, as well as providing information on using the Function Block editor.

# **Quick entry of instructions**

To make your programming tasks faster, **RS**Logix 5000 allows you to map any available alphabetic key (A-Z) on your computer keyboard to a ladder logic programming instruction.

**1.** From the Tools menu, choose Options.

The Workstation Options dialog appears.

Workstation Options		×
<u>C</u> ategories:		
Application     Tag Display     Ladder Editor     FBD Editor	Change general preferences for RSLogix 5000       Project Directory:         C:\RSLogix 5000\Projects       Browse         Image: Enable Look Ahead       Image: Enable Look Ahead         Image: Show Eull Drag       Search Base Tag Description in Operand Comment Display	]
<u>R</u> eset Category	OK Cancel Apply Help	

**2.** Click on the Ladder Editor category.

The Change Ladder Editor Preferences screen appears.

Workstation Options	×
Categories:	Change Ladder Editor preferences         Auto Bung Verification         Insert Mode         Always Show Rung Text Edit Bar         Enable Quick Key         Configure
Reset Category	OK Cancel Apply Help

**3.** Check the Enable Quick Key box, and then click on the Configure button.

Quick Key Config	uration	×
Instruction _Free	Quick Key a b c d e f f g h i i i k	<u>Close</u> <u>H</u> elp <u>A</u> ssign Key <u>U</u> nassign Key

The Quick Key Configuration dialog appears.

**3.** Double-click on a free space in the instruction column or click on the Assign Key button.

The Ladder Element browser appears.

Qu	Quick Key Configuration				
	Instruction	Quick Key a			
	Mnemonic	Label	Direction		
	High Rung High Branch Branch Lev Bit High Dimer/Cour High Compare High Compute/N High Move/Logi	(SOR - EOR) (BST - BND) vel (N×B) nter ut fath cal	▲ y .ey		
	<mark>⊠</mark> <u>S</u> ho	ow Instructions By Gr	oups		

4. Select the instruction to which you want to assign the quick key.

From now on, if the option to enable Quick Key mapping is turned on, when you type the assigned key while in the ladder editor, the instruction is added to your routine.

# **Adding instructions**

There are several different methods you can use to add instructions. You can enter an instruction by:

- manually typing it in
- dragging the tag name from the Tag Editor or from other instructions
- using copy and paste

TIP	You can drag-and-drop rungs, branches, instructions, and addresses.
<b>(</b> )	To drag-and-drop, position the mouse pointer over the item, click
9	and hold down the left mouse button and drag it to another location,
	and then release the mouse button. White boxes indicate valid
	locations; green circles indicate the current drop location when
	dropped.

# **Branching**

## Add a branch

Click this icon on the instruction toolbar to place a branch in your ladder logic. If your cursor is on an instruction, the branch is placed immediately to the right of the instruction. If your cursor is on the rung number, the branch is placed first on the rung.

#### Move a branch level

Click on the upper left corner of a branch to move the branch level to another location in your ladder logic program

#### **Expand a branch**

Click the right leg of the branch, and then drag the leg to the right or left. Valid release points will be visible on the ladder display.

⊫

#### Nest a branch

Place the cursor at the upper left corner of a branch leg and click on the Add Branch button to place another branch structure within the original branch structure

## **Parallel branch**

Place the cursor at the bottom left corner of a branch leg and click on the Add Branch Level button.

# Copy branch level

Click on the left edge of the branch level you want to copy. In the picture at the left, this is the center level. Then click Copy Branch Level in the right mouse menu. Finally, click on a rung or instruction in your logic and click Paste from the right mouse menu to insert the contents of the branch level.

#### **Copy entire branch structure**

Select the right leg of the branch structure, and then click Copy in the right mouse menu. Finally, click on a rung or instruction in your logic and click Paste from the right mouse menu to insert the branch structure

## **Delete a branch**

Place the cursor on the right branch rail, click the right mouse button, and then click Delete. If you cut or delete a branch, all instructions on the branch are also deleted.

## **Delete a branch level**

Place the cursor on the left branch rail, click the right mouse button, and then click Delete. If you cut or delete a branch, all instructions on the branch are also deleted.

# **Online editing**

The online editing function allows you to monitor and correct your ladder program when you are connected to the Logix5550 controller. When you are editing an instruction's tag value field and you commit your edits, the data value change happens immediately for both online and offline editing. When you are online, this only happens to rungs that are in the controller.

TIPOperands whose values will change immediately when you commit your<br/>edits are indicated by a blue arrow.

Within your logic program, **RS**Logix 5000 places zone markers in the margin to the left of the left rail. These letters signify edit zones, and they indicate the type of ladder edits that exist in the routine.

#### Lower-case zone markers

Lower case zone markers indicate edits that exist only in the computer memory. Once you successfully assemble the edited rungs, these zone markers disappear.

Marker	Description
e	These rungs are currently under edit within the computer RAM. If you are working offline, after a successful routine verification, the lower-case e will disappear and the edits will be incorporated into the routine. If you are working online, after accepting the rung, the lower-case e will be replaced by an upper-case I, indicating that the rung is now in the controller's memory and will be inserted into the routine file.
i	These rungs are to be inserted into the routine. Rungs marked with a lower-case i currently exist in the computer memory and will not be entered into the controller until the rung is accepted. After the rung is accepted, the lower-case i is replaced by an upper-case I. These rungs are the same as e-marked rungs, but have already been verified.
r	These rungs are to be replaced in the ladder routine. Rungs marked with a lower-case r are currently marked for replacement in computer memory, but this marking will not be entered into the controller until the rung is accepted. An r-marked rung is always preceded by an e-marked or I-marked rung. After the rung is accepted, the lower-case r will be replaced by an upper-case R.

# **Upper-case zone markers**

Upper case zone markers indicate edits that exist in the controller memory. Once you successfully assemble the edited rungs, these zone markers disappear.

Marker	Description
Ι	These rungs have been inserted in the controller's logic routine. You can test the edits by choosing the Test Edits option to see how the rung works in the online ladder routine. Choose Assemble Edits to finalize the rung insertion and complete the editing process.
R	These rungs have been replaced in the controller's logic routine. Rungs marked with an upper-case R continue to function in the routine until you select Test Edits to see how the new rung works in the online routine. Choose Assemble Edits to finalize the replacement and complete the editing process.
D	These rungs have been deleted in the controller's logic routine. Rungs marked with an upper-case D continue to function in the routine until you select Test Edits to see how the routine functions without the rungs in the online routine. Choose Assemble Edits to finalize the deletion and complete the editing process.

# ASCII editing

ASCII editing is a function of **RS**Logix 5000 that allows you to modify instructions using ASCII instruction mnemonics instead of having to modify instructions using the ladder editor.

To access the ASCII editor, simply double-click on a rung number in the left margin. If you double-click a rung that already contains logic, you will see the mnemonics for the existing instructions and will be able to modify or add to them. If you double-click on an empty rung, you get an empty editing box into which you can type the mnemonics that represent the logic you want placed on the rung.

Note: RSLogix 5000 also allows you to modify instructions using neutral text.

## About the Function Block Editor

When you open a function block routine, it is displayed within the Function Block Editor routine window. This window appears within the main RSLogix 5000 screen. It contains tabs for all open routines, a view for each routine, and a <u>sheet</u> toolbar to help you work with the sheets within each routine.

The routine window components are described below.

#### **Function Block Editor Title Bar**

The title bar of the Function Block Editor routine window displays the scope of the routine, followed by the routine name. If the routine is a controller-scoped routine, the word Controller appears; otherwise the name of the program to which the routine is scoped appears.

Depending on the state of the routine, an additional character may appear in its title. For instance, a \* indicates that the routine has been modified (i.e., it is "dirty").

#### **Sheet Toolbar**

The sheet toolbar allows you to create, delete, or navigate between sheets of a function block routine.

#### **Routine Tabs**

The routine window contains a tab representing each open routine. Each tab is labeled with the name of the routine with which it is associated. Position your mouse over a tab to see a tooltip with the full name of the routine. If there are a large number of routines open, the names are shortened.

To cycle through the tabs, press Ctrl + Page Up; Ctrl + Page Down allows you to cycle through the tabs in the reverse direction.

Click the right mouse button on a tab to display a context-sensitive popup menu that lists operations you can perform on the specified routine.

## **Routine View**

The Routine View is the area inside the Function Block Editor window that displays your function block diagram. Each routine view can contain two view panes of the routine, an upper pane and a lower pane. You can adjust the height of these panes. Each routine view and pane contain their own <u>caret</u>, scroll positions, and zoom capability.

# **Routine Splitter**

When a routine is initially displayed, its upper pane is not shown. By using the splitter bar, you can split the routine view in half, showing two separate panes of the same view. Simply drag the splitter bar up or down to move the bar, or choose Split from the Window menu. To position the splitter bar, drag the splitter bar up or down, or select the Split option from the Window menu.

**Note:** If you use the splitter to close the active pane, all editing operations in the Function Block Editor will be disabled.

Note: To toggle between different panes of a routine view, you can press F8.

## **Routine Scroll Bars**

The routine window contains scroll bars that allow you to scroll the routine view's pane up, down, left, or right. You can scroll this view by using the arrow keys, the Page Up/Page Down keys, or the mouse. In addition, RSLogix 5000 supports the use of the Microsoft Intelli-Mouse. By rotating the mouse wheel, the routine window will scroll up or down. If you hold down the Shift key, and rotate the mouse wheel, the window will scroll left or right.

• Getting Results with **RS**Logix 5000

Chapter

7

# Advanced data monitoring concepts

# Introduction

**RS**Logix 5000 provides you with several means for monitoring and diagnosing problems with your data and the controller you are accessing.

# **Status display**

The standard **RS**Logix 5000 Online Bar contains a heads-up display of the current state of the controller. This status bar also provides you with shortcuts to upload/download programs, change the controller's mode, and other commonly-used features.

# **Program verification with auto-navigation**

**RS**Logix 5000 provides a logic verify feature that automatically scans the program for errors that could prevent the application from being downloaded into the controller. When this verification takes place, the Results window displays a list of errors along with their location within your application.

Accepting rung 0 in routine: MainProgram - MainRoutine Error: Rung 0, XIC, Operand 0: Reference tag not found. Error: Rung 0, TON, Operand 0: Reference tag not found. Complete - 2 error(s), 0 warning(s)	
T Errors /	E

When you double-click on an error code within the Results window, the logic window is automatically moved to the location of the error, so that you can correct it. This verification and auto-navigation can save a great deal of time in your program development process.

Note that while you can navigate to the source of an error by double-clicking (or pressing Enter) on an error message, some errors (and all comments) may not support any navigation. In addition, some errors that do support navigation may lose this ability, depending on your activities. For example, if you edit a routine, you might delete the rung an error message is referencing. In that case, you would no longer be able to navigate to the rung from the message.

The easiest way to inspect and fix your errors is to use the Next and Previous Error menu items (F4 and Shift + F4). You will see the error selected in the Results window, and the editor or configuration window in which you can fix it will be displayed. If you choose Next Error and you are at the end of the list, you will wrap to the first error in the list. Likewise, if you choose Previous Error and you are at the beginning of the list, you will wrap to the last error in the list.

If you want to inspect a specific error, then it may be easier to scroll to the error and double-click on it.

# **Data monitor view**

All of the tags used in a controller can be monitored in the data monitor. This monitor allows you to move through the list of tags in your controller to quickly locate an individual tag.

You have the capability to sort this list by Alias For, Base Tag, Description, Style, Tag Name, and Data Type to easily zero in on the data you need. Once located, you can selectively pick the method or radix (e.g., bit, num, octal, hex, ASCII) used to display an individual tag.

You have the capability, as well, to filter the tags that are shown based on data type. This enables you to show only those tags that fit the data type you select.

Finally, you can also view tags by controller scope. Note that you can only see one scope at a time.

	Controller Tags - LocalAC(controller)

# Forcing

Forcing allows you to override an I/O module's values in the controller. Using the Data Monitor or the Ladder Editor, you can manipulate forces on individual tag elements. From either of these, you can:

- force a tag element on or off (for tags of BOOL type only)
- remove the force from a tag element

If you want to manipulate all forces in the controller, you can use the Online bar or the Forcing command from the Logic menu. Once any tag element is forced, the Online bar force status will indicate that forces exist in the controller, as well as whether forces are enabled or disabled. From this bar, you can also remove, enable, or disable all forces in the controller.

To determine which tags are forceable , choose Forceable Tags from the Data Monitor Show Filter.

**Note:** You can only enable and/or disable forces at the controller level; you cannot enable/disable forces only for a particular module, tag collection, or tag element.

# Chapter

# Getting the information you need

# Introduction

Use this chapter to review the sources of additional information on **RS**Logix 5000 software.

You can find out more about **RS**Logix 5000 software by consulting:

- **RS**Logix 5000 online help
- ControlLogix Quick Tour online tutorial
- **RS**Logix 5000 training
- Technical support services

# **RSLogix 5000 online help**

The **RS**Logix 5000 online help provides general overview information, comprehensive step-by-step procedures, and control definitions. To view online help while using **RS**Logix 5000 software:

- choose Help from the menu on the **RS**Logix 5000 main window
- click the Help button on any RSLogix 5000 dialog box
- press F1 on any instruction, dialog box, menu item, or window view

# **Determining the next step**

To view a list of tasks, open the Common RSLogix 5000 Procedures book on the main Help Topics contents page. From this area, you can jump to procedures related to working with the **RS**Logix 5000 software.

	The <u>Ne</u>	<u>ew Task dialo</u>	g appears.	
	¶ <sub>™</sub>	ip		
	You ca task fo from th	an also access Ider in the Cor e popup menu	: the New Tas htroller Organia 1.	k dialog by right mouse clicking on the zer and selecting the New Task option
2.	Enter a	a task name.		
3.	Enter a	a description fo	or the task.	
4.	Choose the task type from the drop-down menu. Choose from <u>Continuous</u> or <u>Periodic</u> .			
5.	Enter the value (in ms) for the watchdog timer.			
6.	Assign a priority (from 1 to 15) to the task.			
	💡 Tip			
	Lower is assig	numbers indic gned a 1 is a h	ate higher pric igher priority t	rities for tasks. For example, a task that ask than one that is assigned a 15.
7.	Enter t	he rate value	(in ms) to trigg	er the periodic task.
	<sup>®</sup> тір			
	Reduci causing	ing the rate va g other tasks (	alue increases within the con	the frequency of the task's execution, troller to execute more slowly.
8.	Click o	n OK to creat	e the new task	ς.

# **ControlLogix Quick Tour Online Tutorial**

This version of the RSLogix 5000 software contains a link to an online tutorial that you can run to learn about how to configure your ControlLogix system. The ControlLogix System Quick Tour is designed to give you an introduction to the ControlLogix family of hardware, and the RSLogix 5000 programming software, in addition to showing you how to use RSLinx to configure communications to the Logix5550 processor.

This tutorial is designed to simulate a hands-on training session by leading you through the same sequence of steps you will follow when you configure your own ControlLogix system.

While you will not be working directly with the RSLogix 5000 and RSLinx software packages as you go through this tutorial, the Quick Tour leads you through the same sequence of screens and menus that you will see when you launch those packages to set up your own systems.

To run the tutorial, choose ControlLogix Quick Tour from the RSLogix 5000 Help menu.

# **RSLogix 5000 training**

One of the best ways to increase your proficiency at using Rockwell Software products is to attend a Rockwell Software training program. Our training programs can help you master the basics and show you how to unleash the full potential of our software.

We offer a wide range of training programs, from regularly scheduled classes conducted at Rockwell Software facilities, to custom-tailored classes conducted at your enterprise. The size of each class is kept small intentionally to maximize student engagement.

If you would like more information about our training programs, visit the Rockwell Software site on the world wide web or contact the Rockwell Software Training Coordinator. Our world wide web address and telephone numbers appear on the inside front cover.

# **Technical support services**

If you cannot find answers to your questions in the *Getting Results with RSLogix* 5000 publication or in the online help, you can call Rockwell Software technical support at the numbers listed on the inside front cover. The technical support staff is available Monday through Friday from 8 A.M. to 5 P.M. Eastern Time, except holidays.

#### When you call

When you call, you should be at the computer running the Rockwell Software product and be prepared to provide the following information:

product serial number on the Activation disk labels

You can find the serial number online. On the **RS**Logix 5000 menu, click Help, and then click **About**.

product version number

This information also appears in the About box.

- hardware you are using
- exact wording/exact error codes of any messages that appear on the screen
- description of what happened, and what you were doing when the problem occurred
- description of how you tried to solve the problem

Appendix

# Copy protection

# Introduction

Use this appendix to gain a better understanding about Rockwell Software's copy protection.

# **Activating RSLogix 5000**

Rockwell Software uses activation files to provide copy protection for its Windows-based software packages. These activation files reside on the Activation disk. During installation, the software prompts you to insert the Activation disk and move the activation key from the disk to the drive where you are installing **RS**Logix 5000.

## **About the Activation disk**

The **RS**Logix 5000 software package comes with a separate Activation key to activate **RS**Logix 5000. Without activation, **RS**Logix 5000 will not run.

The activation file contains:

one or more activation keys

The activation key is the software that activates **RS**Logix 5000. Depending on your requirements, the Activation disk will have one or more activation keys. For example, if your company purchases four **RS**Logix 5000 installations, you require four activation keys. Multiple copies of the same software require activation keys with matching serial numbers. All of the activation keys can be on the same Activation disk.

- a file called EVMOVE.EXE that moves activation keys to and from computers
- a file called RESET.EXE that reactivates a damaged activation key You can move activation keys off and on the Activation disk. The files EVMOVE.EXE and RESET.EXE always stay on the Activation disk.

#### **Two methods for activating RSLogix 5000**

Depending on your needs, you can activate RSLogix 5000 from a:

**Diskette drive**. Use this method if you will typically use **RS**Logix 5000 on more than one computer—for example, if you want to run **RS**Logix 5000 on a desktop computer and a portable computer.

**Hard drive**. Use this method if you will typically use **RS**Logix 5000 on only one computer. This is the default method if you activate **RS**Logix 5000 during installation. To run **RS**Logix 5000 on a different computer, move the activation key back to the Activation disk, and then reactivate **RS**Logix 5000.

#### Using the Activation disk as an activation key

To use the activation key from a diskette drive, modify the ROCKSOFT.INI file so that **RS**Logix 5000 searches the diskette drive for the activation key. Once you modify this file, you must use the Activation disk each time you start **RS**Logix 5000.

#### To modify the ROCKSOFT.INI file

- 1. Install **RS**Logix 5000 as described in chapter 2.
- **2.** When the Activation window opens, click Cancel to bypass the activation procedure.
- **3.** In Windows NT 4.0, locate the directory where Windows is installed (for example, C:\WINNT40).
- 4. Open the ROCKSOFT.INI file.
- **5.** Locate the string that says: KEYDISK = FALSE.
- 6. Edit this string so it says: KEYDISK = TRUE.
- 7. Save and close the ROCKSOFT.INI file.

#### To activate RSLogix 5000

- **1.** Insert the Activation disk into the diskette drive.
- 2. Start **RS**Logix 5000.

RSLogix 5000 automatically searches the diskette drive for the activation key.

#### Moving activation keys back to the Activation disk

You can move activation keys from the hard drive back to the Activation disk at any time. For example, you could move activation back to the Activation disk:

- to run **RS**Logix 5000 on a different computer
- before installing or using software that could damage the activation files (see "Protecting your activation files" for a list of operations that can damage activation)
- before sending the computer to be repaired

#### To move activation keys back to the Activation disk

- 1. Insert the Activation disk in a diskette drive.
- **2.** In Windows NT 4.0, run A:\EVMOVE.EXE or B:\EVMOVE.EXE where A or B is the drive containing the Activation disk.
- **3.** In the From box, select the drive where the activation key is currently stored. In the To box, select the drive containing the Activation disk. Click OK.
- **4.** Do one of the following:
  - To move activation keys for all installations, click Move.
  - To change the number of activations to move to the Activation disk, select RSLogix 5000, and then click the Edit Selected button. In the Move box, type the number of activation keys to move. Click OK, and then click Move.
- 5. To close the EvMove Summary box, click OK.

#### Activating RSLogix 5000 after installation

You might need to reactivate **RS**Logix 5000 after moving activation keys back to the Activation disk or after resetting a damaged activation key. To reactivate **RS**Logix 5000, you move the activation key from the Activation disk back to the hard drive.

By default, when you move activation to a hard drive from the Activation disk, the software moves only one activation key for **RS**Logix 5000. However, when moving to a network drive, the software moves all activation keys by default. When reactivating **RS**Logix 5000, you can accept a default or choose the number of activation keys to move.

#### To reactivate RSLogix 5000

- **1.** Insert the Activation disk in a diskette drive.
- **2.** In Windows NT, run A:\EVMOVE.EXE or B:\EVMOVE.EXE where A or B is the drive containing the Activation disk.
- **3.** In the From box, select the drive containing the Activation disk. In the To box, select the drive where **RS**Logix 5000 is installed. Click OK.
- **4.** Do one of the following:
  - To move the default number of activation keys, click Move.
  - To change the number of activations to move, select RSLogix 5000 from the list in the Source Drive box. Click the Edit Selected button. In the Move box, type the number of activations to move. Click OK, and then click Move.
- 5. To close the EvMove Summary box, click OK.

#### **Protecting your activation files**

Performing certain operations on the hard drive can damage activation files. Always move activation from the hard drive back to the Activation disk before doing any of the following. After completing the operation, it is safe to move the activation back to the hard drive and reactivate **RS**Logix 5000.

Move activation files back to the Activation disk before:

**Upgrading or installing the computer's operating system**. Upgrading, installing, and uninstalling operating system software or networking system software can damage the Rockwell Software activation files.

**Compressing or uncompressing the computer's hard drive**. Compressing the hard drive with some compression software programs can damage activation software. In addition, uncompressing a hard drive with activation files on the compressed drive can damage activation.

# **Reactivating a damaged activation key**

If the activation key becomes damaged for any reason, visit our world wide web site or call Rockwell Software Technical Support for a reset code. Our world wide web address and telephone numbers appear on the inside front cover.

#### When you call

When you call or access the web space, you should be at a computer with the Activation disk available. You do not have to use the same computer where **RS**Logix 5000 is installed. However, you must have the Activation disk with a serial number that matches the **RS**Logix 5000 software.

The support representative will explain how to find the product ID and system ID from the Activation disk and then will assign a reset code for the activation key. After obtaining a reset code from Rockwell Software Technical Support, reset the key, and then reactivate **RS**Logix 5000.

#### To reactivate a key with a reset code

- **1.** Insert the Activation disk in a diskette drive.
- **2.** In Windows, run A:\RESET.EXE or B:\RESET.EXE where A or B is the drive containing the Activation disk.
- 3. In the Reset Code box, type the reset code, and then click OK.
- 4. Reactivate RSLogix 5000.

# **Troubleshooting activation**

If activation is not working:

- Are you using the correct Activation disk? Check the serial numbers on the **RS**Logix 5000 software and printed on the Activation disk labels—the serial numbers must match.
- Does the computer have a virus? Boot sector viruses can damage the Activation disk. The Rockwell Software support team recommends using a commercial virus protection program.
- Did you save other files on the Activation disk? Saving any files to the Activation disk can damage the activation software.
- Did you perform an operation on the hard drive that damaged the activation software? See "Protecting your activation files" in this appendix.
