

It's 2304 AD. The 5 mile long colony starship, Snowball 9, has been hijacked and sabotaged; its robots modified. Can you save the colonists? This massive pure-text adventure has a wealth of puzzles and over 7000 locations (yes, 7000)!

Level 9 Computing specialise in adventures. Big adventures. We have developed sophisticated techniques for cramming huge games into 32K and now produce versions for many popular computers.

Our games are designed much like novels, with detailed backgrounds and interesting storylines: the result is more enjoyment for you. And don't worry if you get stuck. Just write to us for a clue sheet that will tell you almost everything you could ever want to know about a game.

*Snowball is a huge adventure game. It has over 7000 locations and has taken 9 months to produce. It has a realistic, planned background and is set aboard a starship that could actually work.*

*You play Kim Kimberley, secret agent extraordinary.*

*Your mission: to safeguard the interstar transport, Snowball 9, as a last resort following catastrophic accident or sabotage.*

*Thus when your modified freezer-coffin wakes you with the Snowball still in transit, you know that something must be very wrong. You're weakened and disorientated from lengthy hibernation, but the fate of two million passengers is in your hands.*

*Meet the dumpy cleaning robot, find out what a waldroid is, and (of course) dodge the infamous Nightingales which have proved so good at reviewericide!*

### REVIEWS

"This is another imaginative, massive-scaled, immensely enjoyable adventure from those experts down at Level 9 Computing." — *Your Computer*

"As in all Level 9's adventures, the real pleasure comes not from scoring points but in exploring the world in which the game is set and learning about its denizens." — *Which Micro?*

"The documentation is absolutely first class. There is a 12 page manual of background notes and hints." — *A&B Computing*

"With detailed descriptions, plenty of puzzles, an interesting plot and very fast response to input, this latest adventure from Level 9 continues its high standard and gets my seal of approval." — *Personal Computer News*

#### GUARANTEE

We'll replace the enclosed cassette/disk/microdrive cartridge if you return it to Level 9. If you have problems in the month after purchase, a replacement of the same type is free.

Otherwise, please enclose £1 for a replacement cassette or £2.50 for a disk/microdrive cartridge (if available). Add £1 if outside the UK.

#### OTHER GAMES

Snowball is the first in Level 9's Silicon Dream trilogy, to be followed by:

- 5 Return to Eden
- 6 The Worm in Paradise

Another fine adventure is:

- 7 Lords of Time

#### COPYRIGHT

The game and name SNOWBALL and all associated software, code, listings, illustrations and text etc, are the exclusive copyright of Level 9 Computing. They must not be copied, transmitted, reproduced, hired, lent, distributed, stored or modified in any form without the express written permission of Level 9 Computing.

Level 9 Computing's address is  
229 Hughenden Road, High Wycombe, Bucks, England.

# Snowball

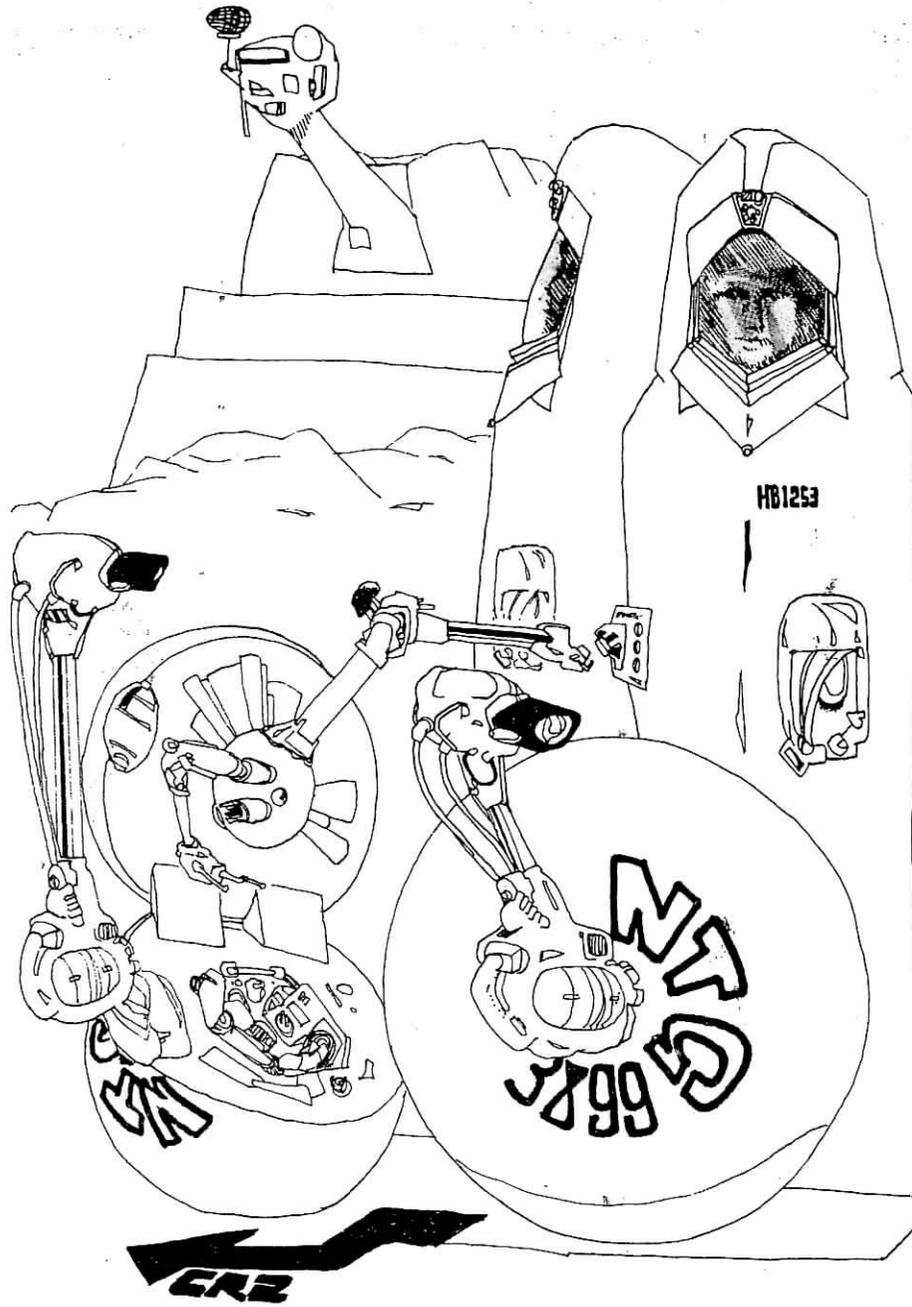

## Snowball

# MTX

## Level 9 Computing

## ETERNAL GUARANTEE

If, at any time, this program will not load satisfactorily, then return it to Level 9 Computing and we will replace it. Our address is in the instruction booklet.

Please state when you bought it from us, the name of your computer, and make and model of your cassette recorder. A brief description of your problem would help too.

We'll replace the cassette free in the first month after buying (or refund your money if you prefer, within this period).

After the month is up, please enclose £1 (£2 outside Europe) to cover part of the cost of replacement.

### LOADING ADVICE

We test cassettes thoroughly and few people should have any difficulties. If you do have problems, however, the following may help:

1. Try both sides of the cassette.
2. If no signal seems to be getting through, load a short program of your own to test that the cassette recorder is properly connected.
3. Try a variety of volume/tone settings (fairly fast and fairly loud).
4. Clean the recorder's head etc., following the maker's instructions.
5. If your recorder seems less reliable lately, the reason may be that its head is gradually becoming magnetised: you should consider using a demagnetiser before your valuable cassettes are harmed. We demagnetise our cassette recorders after every 8 hours of use, and demagnetisers are quite cheap from hi-fi shops (or Argos).
6. Some recorders do not work very well (if at all) with some computers. Could you try loading from another cassette recorder?
7. You may really have a bad cassette (one contained a Beatrix Potter tale!). As a last resort, return it under the guarantee above.

## SNOWBALL

Snowball is a big adventure game. It has over 7,000 locations and has taken 9 months to produce. It's probably unique among adventures in having a realistic, planned background and being set aboard a starship that could actually work.

You play Kim Kimberley, secret agent extraordinary.

Your mission: to safeguard the interstar transport, Snowball 9, as a last resort following catastrophic accident or sabotage.

Thus when your modified freezer-coffin wakes you with the Snowball still in transit, you know that something must be very wrong. You're weakened and disorientated from lengthy hibernation, but the fate of two million passengers is in your hands!

*To play the game, turn to the middle pages for loading instructions and commands.*

### BACKGROUND

Snowball 9 started its journey to the stars from the EEC's Ceres base, one of fifty colony starships launched in the 2190s. It carried the first colonists for Eridani A.

First to be despatched were the ten giant passenger disks, rotating ponderously to provide internal gravity. Each was towed gently by a cluster of small tugs and floated into the void with 200,000 sleeping colonists on board.

Then the Snowball's engine unit followed, accelerated rapidly by the spectacular flares from its four great fusion motors. Like previous launches, and the link-up with the disks some weeks later, this was hold'd worldwide . . . though few people bothered to watch.

Looking like a necklace of sparkling beads, Snowball 9 headed out into deepest space, and into a century of obscurity.

But the major part of the launch was yet to come. And it happened quietly, out of the glare of publicity. The chains of accelerators, beyond Pluto, burst erratically into life throughout the following three years: firing ten-tonne blocks of ammonia-ice at precise speeds

after the receding craft. Once reeled in by the Snowball's skyhooks, the ice was built into a huge hollow shell around the linked passenger disks. When complete, this shielded the disks during the voyage; until the ice was finally needed as fuel for the ravaging fusion drives.

The ice-shell, which gave the Snowball series its name, formed most of the mass of the completed craft. And without the accelerator/skyhook system of "in-flight refuelling", realistic-time interstar voyages would not have been feasible.

As with life, the first thirty years of Snowball 9's journey were the most interesting. The computers and crew had to catch as much ice as possible before it flew past. But even then there were never more than 6 active crew at a time.

Then the starship was left to coast until its destination was near, the crew hibernating with the passengers. A brief flurry of activity to start deceleration, and back to autopilot. Even allowing for the great resilience, and hence low sophistication, of the Snowball's machine intelligences, they are quite capable of running everything unaided. No further crew members were woken until a year from journey's end.

The plan from here on was to continue deceleration, shed the remains of the ice-shield (by now eaten away to insubstantiality by the needs for fuel), and dock with the target planet, Eden, in geostationary orbit. Finally the passengers would land by glider-shuttle. . a process taking many years to get everybody down, and necessitating the retrieval of grounded gliders by sky hook: the same gliders being used many times..

This was the plan, anyway.

Meanwhile in the Eridani star system, the robot descendants of the original survey craft that scouted Eden have been hard at work. The original crude waldroids, directly controlled from the survey craft's computers, were good for little other than routine manual work. But they have long been superseded by a host of specialised robots: highly intelligent and suitable for any task.

Indeed, in the outer reaches of the planetary system the first accelerator chains are already being built. It will not be long before colonists can leave Eden for remoter stars.

The colonists have taken over a hundred years to reach Eden, but the robots can obtain information and programming at light speed. They are immeasurably ahead of their future 'masters' in knowledge and technology. Even if Snowball 9 arrives safely, it is by no means certain that the passengers will be able to cope with the sudden outdating of all their experience.

The physical well being of the colonists is, however, assured by the robot's diligent work. Condos, paveways, PVTs, holo nets, pre-ordained work. . everything necessary for civilised life will be provided. After all, why risk further disruption of the social fabric resulting from a manifestation of the so-called "pioneer spirit"?

All you, as Kim Kimberley, have to do is rescue the Snowball 9. The task of helping the colonists cope with the city that the robots have built can be tackled in the sequel to this adventure: "Return to Eden". Neither will be easy!

## KIM KIMBERLEY

Kim is 1.7 metres tall, weighs 55 kilos, is fairly intelligent, athletic, and has brown eyes and fair hair. Now aged 22, or 25, or 131 years . . . depending on how you calculate these things.

Born on September 29th, 2172 AD, of Jorel Cowans and Alice Kimberley, Kim was raised by the Hampstead Crèche. This was a peculiar place, set amongst decaying buildings, and heavily reliant on a mix of relationship-engineering, behaviour conditioning and Hell-Fire religion. It was finally closed in 2185 for breaches of the Android Protection Acts. It seems to have done Kim little harm however, though possibly contributing to a tendency towards introversion.

Then to the Milton Keynes School of Life: a fine, residential establishment situated (despite its name) in Malta. The staff were, in effect, Kim's family. (This type of situation, by the way, was far from unusual in the late 22nd century. Advances in entertainment and travel, plus the sexual revolution resulting from AI, partho and cloning techniques, made a family up-bringing the exception.)

Kim returned to England for National Service before progressing to Oxford (being not quite bright enough for Cambridge). Kim proved a good student, and established many close relationships, though nothing permanent.

It was during National Service that the event central to the Snowball mission took place, though it went unremarked at the time. Kim was approached, discretely, to do security work. Initially this simply involved training, and occasional surveillance of possible subversives (Unionists, Americans, members of racial minorities etc) but it soon developed into counter-espionage (e.g. arresting Russians who used the public reference libraries).

And then, when the Snowball project got under way, Kim was approached to volunteer for the stars. The Snowball craft were as near automatic as possible, and carried a trained crew in case anything went wrong. But suppose something happened to the crew?

What was needed were one-or-two trained people, carried without the crew's knowledge, who could emerge and take over if something went really wrong. And, with the Snowball 9, it has . . .

## The Game

Snowball is a full scale adventure game, with well over 7000 locations, 700 messages, about 60 objects etc etc. You will have to solve a large number of puzzles while finding your way to the main control room in the engine unit – and saving the starship.

To play Snowball, load it from the cassette and then simply enter English phrases to tell the computer what you want to do (e.g. SEARCH THE ROOM or LOOK AT THE PANEL). The program will act as your eyes and ears to describe your surroundings.

As with all proper adventure games, Snowball is very easy to play – you don't need to be able to type rapidly, or blast aliens by reflex. But don't be too surprised if it takes weeks (or months) to complete.

The best way of playing is probably to use the program in short sessions, stopping if you seem to be totally stuck and resuming if you come up with an idea that might work. Making a map will probably help, though I advise against trying to show all the rooms! Remember that you can use the SAVE and RESTORE commands to save the current state of play and restart later – they are quite quick.

If you have any problems with solving the game, please use the hints card included. You're welcome to enclose it with a letter if you like, but hint-requests may well not be answered unless the card is included.

If you have any problems with using the game program, please tell us which computer you have (and, for cassette problems, which cassette recorder you have). Please help us to help you!

## How to Load and Start

This adventure is a 32K program for Memotech MTX 500 and 512 computers. There is a copy on each side of the cassette.

To use the game, turn on your computer and type:

LOAD "" (and press RETURN). Play the cassette in your recorder and the game will load into memory and start automatically.

Rewind the cassette and replace it in its case once the game has started.

Level 9 Computing wish to thank ARS Microsystems of Camberley, whose MICE-II emulator was essential for the production of this game.

Snowball is copyright © Level 9 Computing 1983.

## Instructions

The program asks "What now?" whenever it expects you to enter another command. Simply type an English phrase to tell it what you want it to do and press RETURN (or ENTER). The program will act on your request, ask you for the next command, and so on.

The program knows an extensive vocabulary of English words (over 200) and it looks at your entered command, picking out the words it knows and 'guessing' your meaning from these. Only two or three words are used for each phrase, so you are advised to keep instructions simple.

In practice you should find it is simple to state what you want to do, but if the program does not understand just rephrase your request.

Snowball provides great freedom in possible commands but, to help you get started, some possible instructions are summarised below:

INVENTORY	SEARCH THE ROOM
LOOK AT COFFIN	PUSH THE GREEN BUTTON
EXAMINE COFFIN	LOOK AROUND
NORTHWEST	GIVE DRINK TO ROBOT
TAKE SPANNER	OPEN DOOR
WEAR HELMET	WHAT'S MY SCORE
DROP THE RED FORM	CUT TUBE WITH SCALPEL

These are only a small sample of the words known by the program. To save typing, words can be abbreviated (e.g. EAST to E, NORTHEAST to NE, and AGAIN to A).

The command analyser used by Snowball is even cleverer than that used in our "Middle Earth" trilogy of games. For example:

- \* Word order is less important. For example "GIVE THE ROBOT A DRINK" is the same as "GIVE A DRINK TO THE ROBOT".
- \* You can take or drop EVERYTHING.
- \* As well as compass directions for movement, LEFT, RIGHT, FORWARDS and BACKWARDS are allowed.
- \* AGAIN repeats the previous command.
- \* Snowball understands IT, and IT can save you time. Use IT if you want to act on the same object as in your last command – but please keep IT simple.

You should know three special commands:

QUIT	Abandon the game. You can start again if you like.
SAVE	Keep the current state-of-play on tape. Start your recorder on RECORD, with a blank tape, first.
RESTORE	Load a SAVED position back from tape.

## Scoring

There are no "treasures" in Snowball: you don't score points for finding things and storing them away as in many games.

Instead, points are scored for doing things that are steps on the way to the eventual goal for getting to the main control room and rescuing the starship from its fate.

For example, you need to get out of the freezer coffin, where you are at the start of the game, and subsequently need to assemble a working space-suit. Both these activities score points.

On the debit side, if you're caught by the Nightingales you lose points. And if you manage to get killed you lose more.

## Hints

Buyers are entitled to a free clue each, and a hints card is enclosed for this. Put it in an envelope, with another stamped, self-addressed envelope, and send it to the address at the back of this instruction booklet. We will do our best to reply as quickly as possible. Don't use up the clue too soon!

Answers will be truthful, but partial answers may be given to questions which take too much work. (e.g. "Please list all words understood by the program" or "What are the functions of all the objects"). We'll try to be fair and help you to progress.

\* Everything in Snowball has a purpose.

\* Remember that the adventure is set in the starship described in this booklet. It is logically designed and there is no "magic". However, some of the technology used might be described as magical in 1980s terms.

\* North means towards the front of the starship and the other "compass" directions are relative to this. Up and down, on the other hand, are determined by local "gravity".

\* At the start of the game, you are in the lowest level of a passenger disk. You need to go "up"

## Terran Expansionary Phase, 2120 - 2210

The late 21st Century saw a great increase in space travel within the solar system.

Fusion power was not yet feasible, conventional fuel sources were close to running out, and the energy needs of the industrial nations were ever-increasing. The solution lay in space. Solar reflectors, if made large enough, could easily concentrate any amount of energy . . . and beaming it back to Earth was simplicity itself.

What was not simple was to transport enough material for thousand-mile reflectors into space. Indeed, it was much more efficient to use what was already there . . . and thus the first accelerator chains<sup>2</sup> were set up to boost asteroid material from beyond Mars into Earth orbit.

By 2120, thirty percent of Earth's energy came from the space reflectors and the proportion was steadily rising. And, to supply the colossal requirements of the orbital industries, the whole Solar System was linked by accelerators.

Then workable fusion power was perfected. And it was very cheap.

The whole space sector of the economy was redundant. And a lot of politicians risked looking very silly indeed.

Thus a use for the accelerators, space reflectors and orbiting factories had to be found . . . and Stellar Colonisation was it. A lot of voters/party members read SF, after all. And colonies are always popular (at first, anyway).

So the accelerators were linked up and fired out of tens of thousands of small exploration probes in all directions. These robots would coast through space with only one mission – as each flashed past a star it would report back the existence of Earth-sized planets. Unmanned, they could continue for centuries.

---

<sup>2</sup>Electro-magnetic accelerators: Linear-motor guns. The payload was slowed down again by sky-hook (a docking unit connected to the main space station by a very long, elastic strand).

Ten years behind came larger survey craft, each clutching a great ball of ammonia ice to power its fusion motor. If one was lucky enough to be following a successful exploration probe, it had just enough time to decelerate (from its coasting speed of 0.3 C) before reaching the star. Once there it would scout the system and if there really were habitable planets (or even ones requiring controlled climate domes as long as the ground was solid) it would radio the information back to Earth.

Then, while waiting for the first colonists to join it, decades later, the survey craft would proceed to prepare a world for them to live in.

First came a long, slow, painstaking period of asteroid mining – assembling the necessary materials to build its first robot-production line. The first robot would take ten or twenty years, the next ten or twenty days and the thousandth would take minutes.

By a process of careful boot-strapping, highly-intelligent space factories were built . . . and colossal dish receivers to collect the constant stream of technological data from Earth.

Next came the landings on the target planet, city building and making ready for the colonists. And, at the same time, preparations for launching more probes and survey craft.

The Terran Expansionary phase was scaled down as time passed, and eventually stopped – as far as Earth was concerned. Domestic political pressures changed, and politicians became more concerned with the quality of life for the so-called Free Nations than with space exploration. But the starships were in flight, and the foundation of the Human Empire was assured.

## Geopolitical Summary, 2195

To generalise: nations can be divided into two groups: the Big 5 super-powers, and the Free Nations.

The Big 5 (China, EEC, Pacific, US Empire and USSR) are fully urbanised, dependent on sophisticated technology, and despite their much-publicised feuding they have reached de-facto compromises to prevent war. Politically, they are neither true democracies nor dictatorships. Most of their populations live in luxury (though the man-in-the-street would never admit this).

The Free Nations are, in effect, the former Third World. No significant improvements have taken place in living standards or technological infrastructure, though populations are higher than ever before. Communications are excellent, however. The people know that they are kept in poverty and resent the fact, and ironically this is a major reason for the Free Nations' poor development performance. Other reasons are: proxy wars, wealth disparity combined with ready supplies of weapons, poor infrastructure, reduced world market share due to automation elsewhere, excess imports to ruling cliques, skill-drain, population growth, endemic disease and climatic instability.

In the near future the Big 5 will finally decide to help the Free Nations, but in the 2190s they are chasing stars.

England, Kim's "birth" place, is a minor part of the EEC. Very prosperous, 50% built-up and with a population of 70 million.

To the evident astonishment of its citizens, who consider it a most boring place, the major industry is tourism. In summer, you can't move in London for the waldroids shuffling around: foreigners soaking in the sights through every gleaming lens.

The biggest employer of labour, however, is the Experience Industry. The Dream Palace of Wigan and Reveline of Bucks churn out epic "adventure games" for the enjoyment of billions worldwide – and for the 30 million unemployed at home.

Housing is good, robot slaves are plentiful, and most people are quietly happy in the belief that their country is best.

## Implementation

Snowball is written in Level 9's own super-compact adventure language known as 'a-code'. This gives machine-code speeds and is much smaller. Additionally, text messages have been compressed to about half size (by the automatic extraction of the most common strings – such as "the" – and their replacement by single characters). Additionally, the coding is rather cunning in places.

Thus the game needs much less space than it ordinarily would – and we can cram in much more detail than others do.

### ADVENTURE REVIEWS

"The programs run very fast and there are no frustrating pauses... Level 9 Adventures are superbly designed and programmed, the contents first rate. The implementation of Colossal Adventure is nothing short of brilliant; rush out and buy it. While you're at it, buy their others too. Simply smashing!"

— *SOFT*, September 83

"Of the programs reviewed here, the only one that is wholly admirable is Level 9's Colossal Adventure."

— *Your Computer*, September 83

"I found Dungeon exceedingly well planned and written, with a fast response. There are well over 200 locations and the descriptions are both lengthy and interesting. The objects number about 100. It could therefore take some months to explore the whole network, giving many hours of enjoyment in the process."

— *Computer & Video Games*, September 83

"This has to be the bargain of the year... If adventures are your game, then this (Colossal Adventure) is your adventure — at an incredible price."

— *Home Computing Weekly*, 5 September 83

"Quite frankly, I think it (Colossal Adventure) is a minor miracle of programming."

— *Popular Computing Weekly*, 12 May 83

"Colossal Adventures, Adventure Quest and Dungeon Adventure... an impressive suite of adventures. They are always a pleasure to play."

— *Popular Computing Weekly*, 23 June 83

"The descriptions are so good that few players could fail to be ensnared by the realism of the mythical worlds where they are the hero or heroine... great fun to play."

— *Which Micro?*, August 83

### FORTH REVIEWS

"For your money you get not only a very good implementation of the popular FORTH language but also a 72 page manual... Once you have got an idea of the fundamentals you should get better value out of this pack than virtually any other program you can buy."

— *LASERBUG*, April 83

"rqFORTH is fast and has a first-class screen editor... a good buy."

— *Computing Today*, July 83

"The editor is a delight to use... The documentation is excellent, the information is clear and easy to find... a thoroughly professional system. It is well up to the standards of the best FORTH systems."

— *Micro User*, November 83

### FORTH TOOLKIT REVIEW

"Level 9 promise to support rqFORTH and this pack proves it... With so much on one cassette it would be good value at twice the price."

— *LASERBUG*, April 83

All Level 9 Adventures  
are now available for:

## CATALOGUE

## LEVEL 9 COMPUTING

## LEVEL 9 ADVENTURES

£9.90

BBC 32K CBM 64 SPECTRUM 48K LYNX 48K NASCOM 32K ORIC 48K ATARI 32K

Level 9 Computing specialise in large, pure-text, puzzle-adventures. We have developed techniques for cramming huge games, taking weeks or months to solve, into 32K and now produce versions for many popular microcomputers.

Every Level 9 adventure has over 200 individually-described locations and large numbers of objects and creatures (though "Snowball" has robots instead). This means between 500 and 800 text messages with a total size, when printed out, greatly exceeding that of the whole adventure program.

We try to take care when designing games; constructing them much like novels with detailed settings and reasons why the puzzles are where they are. You should not find "unguarded" treasure or trees growing in the desert without a good reason! Thus the games can be solved by logic and inspiration rather than luck.

Each game includes a booklet describing its background and giving instructions on play, and an envelope for use in requesting clues if you get really stuck.

To play a Level 9 adventure, you simply type in English phrases (e.g. READ THE SCROLL) and the program acts as your eyes and ears - reporting what happens and what you see.

Any of our adventures will probably take you quite a long time to complete: estimates are printed below but don't be surprised if you take longer. Naturally you can save the state of play on cassette (which takes a few seconds) and return to everyday life for a while - resuming the game later.

### MIDDLE EARTH ADVENTURES

#### 1: COLOSSAL ADVENTURE (4 weeks/Anon & Pete/Mike/Mike)\*

A complete, full-size version of the classic mainframe game "Adventure", with all the treasures, creatures, rooms and puzzles of the original. And a complete new end-game, with 70 new locations, has been added as a bonus. No one else gives you this.

Meet the giant green snake, dragon and monetarist troll, and watch out for the pirate!

#### 2: ADVENTURE QUEST (4 weeks/Pete/Pete/Mike)\*

Hundreds of years have past since the time of Colossal Adventure and evil forces rule the land. Only one hope remains: you must follow the forgotten routes of the Old Roads to the Black Tower, source of the evil power of the Demon Lord.

The way is long and dangerous, but with cunning you can circumvent all obstacles and collect the four Stones-of-the-Elements and enter the tower for the final confrontation.

#### 3: DUNGEON ADVENTURE (8 weeks/Pete/Pete/Mike)\*

In the final adventure of the Middle Earth trilogy, AGALIAREPT has been defeated and the Black Tower split asunder. Its dungeons, filled with magic and treasures from the height of the Demon Lord's power, lie unguarded (well, almost). Can you get to them first - before the orc army closes in?

This is our largest adventure with over 100 puzzles to solve.

### THE FIRST "SILICON DREAM" ADVENTURE

#### 4: SNOWBALL (2 weeks/Pete/Pete/Mike)\*

The massive colony starship, Snowball 9, is off course and heading directly at the star Eridani A. When your freezer-coffin wakes you, weakened and disorientated by long hibernation, the fate of the 5 mile-long space-ship is in your hands.

This adventure will be followed by "Return to Eden" and "The Worm in Paradise"

### THE LORDS OF TIME SAGA

#### 7: LORDS OF TIME (4 weeks/Sue Gazzard/Pete/Mike)\*

A band of evil timelords are plotting to bend the history of the world to their will. You must travel through time and collect 9 crucial objects from critical times in history to defeat them. Chill to the ice-age, get stoned with the cave-men, get lost in the Dark Ages etc!! But my favourite is the woolly jumper!

\*Estimated length/Game designer/Game programmer/Implementer. Omitted surnames are Austin.

#### rqFORTH

BBC 16K/32K

£15

FORTH is a powerful, extensible language which is easy to use and runs much faster than BASIC. rqFORTH is probably the best version of FORTH for the BBC micro and it:

- ★ comes with a 72 page technical manual;
- ★ and a quick reference summary card.
- ★ copes with MOS 0.1, 1.0 and 1.2;
- ★ is FORTH-79 STANDARD;
- ★ provides 260 FORTH words initially;
- ★ permits use of all graphic modes;
- ★ allows full use of the BBC's powerful operating system via \*MOS, CALL and EMIT;
- ★ is used by hundreds of people, worldwide.
- ★ and a 20 page disc supplement;
- ★ It works with cassette and disc;
- ★ needs no added hardware;
- ★ has many fig-FORTH facilities added;
- ★ can be extended as you wish;
- ★ has a superb full-screen editor;

#### FORTH TOOLKIT

BBC 32K

£12

Our toolkit provides over 50K of source code for all kinds of useful rqFORTH routines, about 200 new functions in all, useable individually or in combination. Tools include:

- ★ A FULL 6502 ASSEMBLER for machine code within your FORTH programs. This provides all the 6502 opcodes, allows jumps or structured programming (IF..ELSE etc), and can be removed from memory after its job is done.
- ★ TURTLE GRAPHICS, as glamorised by the media, for easy-to-use colour pictures.
- ★ LOCATING WORDS to find where functions are used, to help in debugging.
- ★ DECOMPILER WORDS to convert compiled FORTH back into source on the screen. Optionally displaying the addresses of words used, decompiling referenced words in turn, decompiling a group of words, or generating source on tape. Very versatile!
- ★ DOUBLE NUMBERS to cope with arithmetic on very large numbers.
- ★ CASSETTE FILE HANDLING, PRINTER & JOYSTICK HANDLING, and BIT-MANIPULATION

#### COMPASS

LYNX 48K/96K

£15

COMPASS (Compression Assembler) is simply the best assembler available for the Lynx.

- ★ COMPASS is a full Z80 assembler, providing all the standard opcodes and "pseudo-ops" plus conditional assembly, turning listing on and off within the program, and defining the execution address.
- ★ COMPASS provides source compression. With other assemblers you would soon run out of memory, but COMPASS holds the source text in a compacted form so programs can be much bigger with no problems, and loading/saving is much faster!
- ★ The cassette contains standard COMPASS which uses about 8K of memory. But it also contains a special version that runs mainly in the alternate green bank - Lynx memory that is otherwise unused. This version only uses 256 bytes of your valuable memory space! Just switch to the special version when your program grows bigger and carry on working!
- ★ Standard COMPASS is super-fast, assembling about 3000 lines per minute. The special banked version manages a respectable 500 lines per minute.
- ★ COMPASS also provides find/find-and-change commands; hex/decimal/character data; long label names; text error messages and checksums to guard against routine programs
