**Edited by Tim Marstian**

**Artwork by Anthony 'Joe 90'**

**Executive Editor**  
**Keith Hook**

MEMOPAD IS PUBLISHED BY SYNTAXsoft FOR THE MEMOTECH USER GROUP  
UNIT B20, THE NORTHBRIDGE CENTRE, ELM STREET,  
BURNLEY, LANCs. BB10 1PD  
TELEPHONE: (0282) 38596

COVER PRICE £1.35. MEMOPAD IS COPYRIGHT SYNTAXsoft 1986

AVAILABLE BY SUBSCRIPTION ONLY.

## Editorial

The clocks have been put back and the dark nights are now drawing in. Soon, it will be Hallowe'en and time for all you tappers to take advantage of Black Beauty by spending comfortable nights close to the fire-side rather than playing darts in the pub.

We have two new programs to offer you this month - **QUEST ONE & TYPESET**. Type-set is a utility package that allows you to design different print fonts and interface them to NewWord in a similar manner to the .Dot commands. This program represents a few hundred hours development and comes from the same programmer who designed Memosketch. At this moment in time it is only available to users with the 250K SDX system but we are trying our best to integrate it to all packages. A full review will follow in the next issue.

Quest One is an adventure game which can be played using a joystick or cursor keys. The game has over 10K of program text, is menu driven and is rather unique in the way you enter your commands. There is a save and load feature so that you do not need to 'go to start' every time you boot up. The general idea is to discover who murdered Lord Grove, and having uncovered the perpetrator of this dastardly deed, you must then state their motive.

Don't forget that all you CP/m buffs can take advantage of the INFOCOM series of adventures such as: ZORK, SUSPENDED, WISHBRINGER, SORCERER and many more. As most of you know, Infocom adventures are the ultimate in text orientated games.

Syntaxsoft is off to Holland during November for the Computer Show at Utrecht. Last year was a tremendous success, and with the demise of the Dutch User Group we are looking forward to meeting our friends, and we hope to assure them that we will continue to support them from England.

It is now time for me to eat humble pie. I must apologise for an article published in the last edition. O.k. Anyone can make a mistake but most people don't have to suffer the verbal lashing dispensed by KH. So, all the Memopad helpers apologise for the FORTH listing - it was completely fouled up and presented in a totally wrong format. We have not published PT2 as we shall start from scratch with the article next month and hope that we can then do justice to the author who presented a marvellous piece for the magazine but we managed to mess it up. Sorry !

By the way, anyone wondering why COBRA was number one last month, the answer is simple - as most of you know, Xaversiene pulled out of the computer field many months ago and Syntaxsoft bought all their stocks - last month we had a big order for Cobra from the Middle East and our charts are plotted on sales data supplied by Syntaxsoft.

It is amazing. I wish you could be here. It is now 4.25 in the morning and Syntaxsoft's offices are like a football ground - programmers are scurrying about, heads down and bumping into each other, and occasionally one can hear the "...there's no reason why the b..... thing shouldn't work." Most of the lads have worked 36 hour shifts, gone to bed and then done another 24 hours of programming. Even I have to utilise the early hours in order to get computer time. This is the result of companies such as Activision, Mastertronic, Virgin, Global etc. relying on Syntaxsoft to get their conversions ready for the Christmas build up. Never mind, these same programs will eventually end up on Black Beauty - this is the deal Keith sets up.★

FM

## SOFTWARE REVIEWS

### Write-Hand-Man      Poor Person's Software

CP/M      £29.95

'Write-Hand-man' is a CP/M 2 version of a program better known as the Borland 'Sidekick' for the IBM PC. Like Sidekick, it offers a selection of utility programs accessible during the execution of another program by typing a predefined trigger character at the keyboard. The concurrent operation is quite illusory, but extremely convincing. The utilities include a notepad, a 14-day calendar a phonebook (which can be linked to a modem for auto-dialing or to the CP/M LST: device), a 4-function calculator, a Hex calculator and an ASCII code table.

The program is very well designed, and differs from Sidekick only in the compromises which it makes with the more limited memory available to the CP/M TPA. The driver program occupies only about 2Kb of the TPA.

WHM works with any program which actually uses CP/M to drive the terminal (i.e. it DOESN'T work with FDXB or SDXB7). With some program such as Newword or Wordstar some selection of a suitable trigger character may be needed.

I think one could become quite fond of this gadget. Far from being an Executive Toy for Computer Yuppies, its uses seem to be limited only by one's own imagination (you can add your own extensions) and people who do much serious programming may well think that on-line hex and decimal calculators, a notepad and a code table are themselves worth £29.95.

---

### Pascal-80      Hisoft Ltd      CP/M 2      £39.95

Pascal-80 is the latest version of the series of Pascal compilers produced by Hisoft, and is a lineal descendant of the compiler on the MTX Pascal ROM. It is supplied with a full-screen editor called ED80. To be precise, the disc which I bought has two versions of both the compiler and the editor, as Hisoft are currently in the process of updating it (the latest full documentation has not arrived yet).

ED80 is best summed up by saying that it behaves like the non-documented mode of Newword or Wordstar, and uses the same control codes, although either of the word processors is a little easier to use (more HELP messages). The upgraded compiler is supplied with an 'interactive' version of ED80, which allows immediate return to the editor in event of a compilation error (as in the Pascal ROM). You have to install ED80 or HPE for the Memotech - the terminal codes are all in the CP/M User Guide and most users will not want to change the control codes in view of their similarity to those of Newword. You can configure the MTX function keys by writing a .KBD file to use as a parameter of F.COM.

HP.COM (the latest version of HP80.COM) is a nearly full implementation of the Jensen-Wirth standard and supports FILES of any reasonable (or unreasonable - I tried some rather strange things like FILES OF ARRAY OF SET -) type, and also record variants, although I suspect that there are restrictions upon the nesting of variant fields (the full documents have not yet arrived). A CHAIN command allows run-time

overlays to be used, and, while there are no machine-specific features and, therefore, no graphics (it is a classical Pascal compiler in that respect), MTX users will not find it difficult to write suitable library extensions as system programming facilities are provided via PEEK, POKE, ADDR, SIZE, INLINE, USER and a CP/M command which can access the CP/M BDOS functions as well as the compile time option to relocate the run-time stack. A very full set of compiler options includes the possibility of excluding the TRANSCENDENTAL and REAL library functions to optimise the size and speed of object code in programs using only integer maths. Error messages are verbal rather than numeric, and the bug in the ROM version which aimed the error-pointer at the next line rather than at the relevant line has been fixed. Pointers still have to be declared iteratively - the most obvious non-standard feature - but list processing addicts will be pleased to know that the procedure DISPOSE is now provided as well as mark and RELEASE. File-handling is about as standard as in any Pascal System, and the addition of a second parameter to RESET and REWRITE giving the drive and the CP/M filename is an improvement on many 'standard' approaches.

Both HP80.COM and HP.COM are case sensitive as the MODULA-2 compiler, but without the latter's whimsical distribution of upper and lower case in its RESERVED words. As far as I know, this is allowed by the Pascal standards, but is unusual. You can now do some very unpleasant things, such as declaring 'I' to be an integer variable and 'i' to be a FILE OF RECORD, but in the interest of your own sanity and that of other people you should not!

Pascal-80 is a direct native-code compiler with no intermediate P-code or linking stage, and it compiles very rapidly for a disc-based system. The usual facilities for external compilation are provided. HP.COM may be used either interactively or non-interactively, and in the latter case the source code may be written with Newword, Wordstar or with ED.COM.

Pascal-80 is a very impressive tool indeed. At about half the cost of Turbo-PASCAL it can only be compared with it. Both are not quite full versions of the language. Both offer facilities for some system programming. Both are non-standard in some respects, but whereas Turbo-PASCAL is quite idiosyncratic, the Hisoft compiler has now very standard syntax indeed - you could get away with a lot on the earlier compilers which will not work on this one! Pascal-80 is about 15% faster than Turbo-PASCAL and can generate source-code which may be up to 30% smaller.

Both of these programs are marketed by: The Software Toolshop

# Legible Listing by Gary Dickinson

This program is designed to help make listings more legible and has the following functions.

1. Text can be changed from upper to lower or visa versa by poking 64080 with 1 (lower to upper case), 2 (upper to lower case) or 0 (leave as it is).

2. Any command can be highlighted by poking 64081 with the command mode or with 0 to highlight none of the commands.

The keyword Tokens can be found from locations 9531 onwards.

3. Multi-Statement lines are split up which makes lines much easier to understand.

4. Any machine code in a program is just listed as "code" therefore you don't have to read large amounts of code.

5. Keywords can be changed by poking 64079 with the keyword to be changed and 64078 with the keyword to change to.

This is very useful for example if you want to direct any text to the printer by changing PRINT to LPRINT.

Please note that if the keywords are the same then the program will not be altered.

6. The program prints out the amount of memory used.

Some of the Sub-routines could be used in other Z80 based programs, for example the routine between #80C3 and #80FF prints a number between 1 and 65535 given the number in 'HL'.

Another routine you could use is the routine between #809A and #80C1 this changes a letter given 'HL' points to the letter ) only if the letters are between a to z and A to Z, any other characters are ignored.

Although the program looks long it only occupies 360 bytes, if however you find it a daunting task to type in I can send you a copy for #1.00 to cover the tape and postage and packing.★

## Typing Errors

In Issue 11+12 of MEMOPAD there was a program by John Simpson. This program, titled "Corners, Circles and Axes", had 1 or 2 typing mistakes.

Line 120 should read,

120 PLOT 185,46

and lines 380 & 390 should look like this,

380 CIRCLE 135,96,X  
 390 NEXT X

We would like to apologise for any inconvenience caused.

Also, the article a few issues ago entitled "Noddy" had quite a few typing errors which we would also like to apologise for. ★

Dear Sir,

I started computing about six years ago on a second hand 8K Commodore Pet. After about six months I was finding the Pet very limiting with its 8K memory and no high resolution graphics so I sold it. I then went for a long time just buying computer magazines reading all the tests on the different machines looking for the one I wanted to upgrade to. In the end after many months I decided on the Memotech MTX 512 which had all the points I was looking for. When I bought my machine it cost #315.

At the time I was quite happy paying this amount, I have since become rather upset at the new prices which keep on dropping. Why keep dropping the price of the computer and not the rest of the hardware?

I am sure the computer would still be a bargain if sold at a price of say #130 instead of its new price of #80. If the extra #50 was taken off the price of a disc drive instead at least those of us who were original buyers would get some benefit after paying the development costs of the computer. After all the Black Beauty is so well built, (Mine has been used daily for three years and never broke down, never not loaded first time etc.etc.), I will never get the benefit of the new prices at this rate.

When I visited your old offices a few months ago, I spoke to Keith and he said the new owner was trying to do something for those of us who had kept the faith, we are all still waiting!

Finally, when I purchased my machine Memotech said they were bringing out a Flight Simulator, this did not appear. A few months ago in Memopad you stated there was going to be a Flight Simulator, don't say this one is going to fly the way of the old one!

After reading this letter I have to ask myself why I keep the faith.

Yours sincerely

N.J.S.Woodger

Can anyone give Gary Wilkinson from Bury, Lancs, any help on the adventure 'Caves of Orb'. He writes in with the following questions:

- 1) How do you kill Medusa?
- 2) How do you pick up the magic wand?
- 3) How do you get past the lazer?
- 4) How do you break off the extra jagged edge from the jagged room?

Unfortunately, nobody at the office can give any help or assistance because no-one has played the game. If anyone can answer these questions please write to Memopad and we will publish the answers in the next issue. Also, if anyone else has any queries relating to adventures on the Memotech you can write in and we will include them in VIEWPOINT for any other readers to answer.

E. Nankivell from Lewes, Sussex wrote in with the following comments.

Dear Sir,

I was prompted to write after reading Alan Rothwell's letter in praise of the reliability of the Black Beauty, for this has not been my experience.

I have one of the first MTX/FDX systems. Both parts have been back to the works a few times.

However, I, too, have praise for the helpfulness of Paul Parry, and I am glad he has continued to work for the Company following the receivership and buyout.

I think the main problem has been sorted out, but not without many lost files, tearing of hair, ruining the day I set eyes on Black Beauty, visits to and from Securicor, etc, and going up a few blind alleys!

The problem was the crashing of Newword on Saving. It would crash into ROM mode, and sometimes wouldn't reset into FDX without much switching on and off, hitting, unplugging and replugging of the comms board, etc. Usually the edit would be lost, with the hated BDOS error coming up.

It took so long, because I tried various cures, which always seemed to work for about 4 weeks, then the fault would creep back again, very intermittent at first, but progressively worse with time. Then another cure would be found which would work for about 4 weeks.

After much toing and froing, and it took a long, long time to come up with this cure, Paul soldered the comms board to the main board. This really did fix it. I reckon the real cause is Memotech's non-use of gold contacts.

Anyroad, in the meantime we fixed all the other problems except one. So I am wondering if I am the only one who has this. It is a problem with (Disk) Newword. When printing a file, it often (but not always) puts part of a form feed between page 1 and 2. The actual length varies, but it is usually a half to 3/4 of a page. I have to be ready with fingers on CTRL and P keys in case it does it. It only happens between pages 1 and 2. This means I can't ask for, say, 5 copies of a document of 2 or more pages, and go away and leave it printing. The same documents don't do it when transferred to MSDOS by COMPAT and printed on the IBM PX AT at my work, under Wordstar. The version of Newword I have is version 2.02 MEM 75-040531.

On the subject of Newword, I wonder if there have been any updates. Compared with the version of Wordstar I use at work, I notice some improvements of NW over WS, but a couple of useful features NW lacks are.

(a) ^N which converts the Block facilities to "Column" mode. I can't emphasise enough how useful this facility is for me.

(b) The ability simultaneously to print one document and edit another.

Recently I had a problem of CP/M renaming my files, which it then could not find. Lower case characters would appear in the displayed filename. They would be according to DIR and the size would be right according to STAT but they could not be TYPed, found by Newword, or ERAsed. I phoned your office and someone advised me (you?) to look at the cards in the FDX. I inplugged all the easily

unpluggable cards, smeared electrolube on their edge connectors, and replaced. So far this has entirely fixed the problem - thanks.

Turning now to Supercalc, is there a graph-plotting utility for it. I would like it to be able to go to table of figures in a spreadsheet, and plot a series of graphs from it. My version is 1.12, S/N-016926

Turning now to Dbase II, which I don't have, I guess I would pay about \$100 for it, do you think there's is a chance its price will fall to this level, or below? I might also be intrested in a DRDRAW type graphics program, (with save to disc) but ideally one that accepted an input from a graphics tablet. Have you used DRDRAW? I use it on the AT: it's very user friendly, and it's only shortcoming from my point of view is its inability to draw fractals. (If that's the word.) It only draws pictures made from straight lines, or arcs of circles, it does not have the equivalent of freehand.

It is one of my ambitions to obtain a modem and communicate with bulletin boards, etc, with the ultimate aim of E-mail, to the USA, Austrailia, and New Zealand. A lot quicker and perhaps cheaper then the GPO or whatever it currently calls itself. I have a lot of correspondence from a few people in those countries. But I don't want to be a pioneer in this! I want to be told what to get and how to set it up - when it's feasible.

Apologies for allowing this letter to ramble - I hope the genuine queries can be easily found from within the waffle. Now, it may be that my subs are now due. I think my number is 000618. Could you confirm this and let me know what the subs are? I certainly want to keep reciveing MEMOPAD.

Yours faithfully  
E. Nankivell

In reply to your MEMOPAD query, your membership is now due for renewal and the membership fee is now \$18.00. The answer to your other question regarding SuperCalc, there is no graphic-plotter utility available.

I am proposing a Memotech users get-together for March or April 1987. Keith Hook of Syntaxsoft, and Phil Ayres of the Memotech Owners Club have pledged their support and I have been in contact with Geoff Boyd of MCL with a view to gaining his support.

I am offering to organise the event at cost, so the rest is up to you! ----- READ ON.

THE EVENT - A weekend show, with current hardware and software in action, plus the chance to meet other users and, hopefully those of you with your own contributions will bring these along.

THE VENUE - To be decided, and to suit the majority.

THE COST TO YOU - Total cost divided by total attending, so the greater the support, the less the individual cost.

WILL IT HAPPEN? - Only if there is sufficent response from you!

INFORMATION - Please fill in the questionnaire below and return it to me before the end of December. Depending upon the number of positive replies, further details will be published in the January U.G. magazines.

Please do not worry Keith, Phil or Geoff for information - all queries should be sent to me, with an S.A.E. for the reply.

THE QUESTIONNAIRE

1. I am interested in attending, preferably in the ☐ North ☐ South
2. I have a Hardware item I can bring along and demonstrate ☐ Y ☐ N
3. I have a Software item I can bring along and demonstrate ☐ Y ☐ N
4. I have a Programming / other skill and will be willing to give a short chat on the subject ☐ Y ☐ N

Please enclose details if you have answered yes to items 2-4, or if you have any ideas you wish to propose.

5. Your Name  
Address  
Tel No

Replies to:- C.M.Taylor, 25 Newleaze Park, Broughton Gifford,  
Melksham, Wilts. SN12 8PL.

The rest is up to you!

STOP PRESS - G. Boyd has assured his support.

Dear Sir,

I would be grateful if you could print the following request in some future issue.

Can any reader tell me how to get through the door in the ninth level of Lords of Time. Presumably I have failed to collect some required item(s), or should I use a password?

Please telephone after 6 p.m. on 099386502.

Keep up the good work!

Cheers

John Tordoff.★

# The Z80 Counter Timer Circuit (CTC)

by A. F. Wilson

The Z80 CTC is a chip device providing four independently programmable timing circuits or channels. Each of which may be operated as an interval timer driven by a Master Z80 system clock, or as an event counter where an external signal is used to control the timing logic. An interrupt to the Z80 CPU will be requested after a pre-set time has elapsed or a pre-set number of events has occurred.

The Z80 CTC can be visualised as consisting of an Interrupt Vector Register and four Counter/Timer channels (channels 0-3) each consisting of:

1. A Control Register
2. A Time Constant Register
3. A Down Counter Register

The Interrupt Vector Register is associated with Channel 0.

The Z80 CTC assumes the Z80 CPU is operating in Interrupt Mode 2 and the Interrupt Vector Register contains the Address Byte to be transmitted upon receiving an Interrupt acknowledgment from the Z80 CPU. When in Interrupt Mode 2 the sequence is :

1. The Peripheral interrupts the CPU with an Interrupt request.
2. The CPU acknowledges the request and the Peripheral then supplies a 1 Byte Vector word.
3. The CPU uses this as the Low Byte of an address fetching the High Byte from the I Register.
4. The two Bytes stored at this address are then loaded into the program counter and CPU execution continues.

The Control Register contains the Control Code defining the operational parameters for the channel. Each is independent from another.

The Time Constant Register contains an initial counter or timer constant which is maintained unaltered until overwritten with a new value. Its contents are copied into the Down Counter Register at the beginning of a Counter/Timer operation, which is then decremented by either external or systems clock stimulus, depending on the channel's mode of operation.

## OPERATING MODES

### 1. Timer Mode

- a) Select time mode with appropriate control code.
- b) Load time constant.
- c) Timer is started, depending on control code sent: either by the system clock pulse following the loading of the time constant register, or by external stimulus. When the timer starts the down counter register is loaded from the time constant register.
- d) The down counter register is then decremented every 16th or 256th (determined by control code) system clock pulse. With a 4MHz (250 nano second clock) the down counter register is decremented every 4 or 64 micro seconds.
- e) When the down counter register decrements from 1 to 0 a time-out occurs. If the channel interrupt is enabled, an interrupt request is sent to the CPU while the time constant register is re-loaded into the down counter register and the sequence repeats from e.

## COUNTER MODE

1. Select counter mode with appropriate control code.
2. Load time constant.
- 3 Counter is started by first active transition of external input. The External Source Active Transition is defined by the control code as: The signal going low-to-high OR signal going high-to-low.
4. The time constant register is copied to the down counter register.

5. The down counter register is then decremented every time the external input makes an active transition (see 3).
6. When the down counter register decrements from 1 to 0 a count-out occurs. If the channel interrupt is enabled, an interrupt request is sent to the CPU while the time constant register is re-loaded into the down counter register and the sequence repeats from 5.

The external inputs to the Z80 CTC on the MTX are:

CHANNEL	SOURCE
0	VDP interrupt
1	4 MHz/13
2	4 MHz/13
3	Cassette input

NOTE: If a new time constant is written to a channel after a control code specifying continued operation two situations may occur:

1. If a timer is running nothing happens until the next time out when the new time constant is loaded into the down counter register.
2. If a time out is in progress with the down counter register being re-loaded, then an undefined value will be loaded into it. However, the new time constant will be correctly loaded at the next time out after an undefined time interval.

#### PROGRAMMING THE Z80 CTC

Basically the steps required to control the CTC are:

1. To send it an interrupt vector.
2. For each active channel to send one or more control codes, initially to set counter/timer operations and to load the time constant register, and subsequently to start/stop the channel, change the time constant or re-define a channels's operation.

In the MTX, the four channels are addressed through I/O ports as follows:

CHANNEL	I/O PORT
0	8H
1	9H
2	AH
3	BH

#### INTERRUPT VECTOR

The interrupt vector is written as one byte of data to channel 0 as follows:

Bit 7  
Bit 6  
Bit 5: Address bits determined by  
Bit 4: Programmer  
Bit 3  
Bit 2  
Bit 1: Must be zero  
Bit 0

When the interrupt vector is sent to the Z80 CPU during an interrupt sequence Bits 2 and 1 are set by the CTC to indicate the channel causing the interrupt as follows:

BIT 2	BIT 1	CHANNEL
0	0	0
0	1	1
1	0	2
1	1	3

In memory the interrupt vector table must start on an 8-byte boundary and stores four 2 byte addresses as follows:

ADDRESS	STORES
FFF0H	Interrupt handler start address for channel 0
FFF2H	Interrupt handler start address for channel 1
FFF4H	Interrupt handler start address for channel 2
FFF6H	Interrupt handler start address for channel 3

#### INTERRUPT LOGIC

Each channel has its own interrupt logic (each to be individually enabled/disabled under software control) allowing it to generate an interrupt request when the channel times are count out. The CTC handles the phase where more than one channel requests an interrupts simultaneously, and assigns priorities with channel 0 having highest priority and channel 3 the lowest.

#### CONTROL CODE

The control code is written as one byte of data which is interpreted as follows:

BIT 7	1-channel interrupt enabled 0-channel interrupt and disabled
BIT 6	1-counter mode 0-timer mode
BIT 5	1-In timer mode, decrement down counter register every 256th system clock pulse 0-In timer mode, decrement down counter register every 16th system clock pulse
BIT 4	1-Trigger on rising edge (high true) 0-Trigger on falling edge (low true)
BIT 3	1-In timer mode, if timer stopped then start external pulse 0-In timer mode, if timer stopped then start on next clock pulse after receiving time constant
BIT 2	1-Next data byte is time constant to channel 0-No time constant follows
BIT 1	1-Reset. Stop current channel operation - re-start using new control code 0-Continue channel operation
BIT 0	Must be 1 to identify control code byte.★

# Smart EPROM Decoder

Dear Memopadders,

I first wish to apologize for the typing errors which were published in issue 11 + 12. I honestly thought there weren't any. Please don't blame my English teacher; their life is already a mess as it is!

First let me help out a fellow reader, Mr D Clement from somewhere city, UK.

He is a victim of the versatility of our BLACK BEAUTY. He noticed to his horror, that the screen colours are reset whenever the MEMOTECH expects a line or command from the user. This is frustrating, but unfortunately can not be changed in BASIC. The first things the computer will do on entering the EDITOR is to restore all SCREENS. This data is usually stored in ROM and can not be altered by us humans. The only thing we can do is to write an interrupt driven program which restores YOUR colour. This has one big disadvantage. Upon entering the EDITOR, the screen will quickly change to BLUE/WHITE and back to your selected colours. In other words: the screen will blink!

If you don't find this annoying here is a program to perform the task:

```

4007      LD A,£C3
4009      LD (£FA98),A      ;Install JP opcode
400C      LD HL,INT
400F      LD (£FA99),A      ;The address to jump to
4012      LD HL,£FD5E      ;The USERINT location
4015      SET 4,(HL)        ;Make it a 'user' interrupt
4017      RET
4018 INT: DI                ;Disable interrupts
4019      LD A,(£F000)      ;Address 61440 contains colour
401C      OUT (£02),A
401E      LD A,£87         ;Address VDP register 7
4020      OUT (£02),A
4022      EI                ;Install pending interrupts
4023      RET

```

The next entry is an intelligent EPROM bank. The decoder will allow 6 EPROMS to be decoded ranging from ROM 2 to ROM 7. Hardware buffs will see that ROM 0 and 1 are meant to be for INTERNAL use. The card uses the R0, R1, R2 and GROM decoder lines from the MTX edge connector. The IC's used are 74LS00 and the 74LS138. The latter is the REAL decoder. This chip is a 8 out of 3 decoder. This chip uses the R0, R1 and R2 as its select input together with the INVERTED GROM. The GROM signal is fed to ALL EPROMS without decoding. Its task is simply to enable the output of the EPROM. The CE is applied to only one EPROM at the time so this causes no problem! A byte can only be read from the selected EPROM if both CE and OE are LOW. Of course the EPROMS only work in the area #2000-#4000. If you wish to insert AUTO-RUN EPROMS in the sockets, be sure that the AUTO-RUN EPROM you wish to start from is in the socket with the lowest select-line.

```

This little utility handles all existing variable types of the Memotech with one condition! The variable name is NOT to exceed 80 characters. Personally I don't think that anyone should need a variable name that long, but I am surely not the crank to try it out just to see what happens.....

You didn't really think this was all, did you? Bad luck.

Next on this show, the TAPE utilities. Get ready.....

```

10 VS 4:CLS:PAUSE 1000
20 CODE

The TAPE handling if the MTX has been reviewed in the 'MEMOPAD' some time ago, so I'm not getting into detail of this. The program saves a GRAPHICS screen to the tapewith out any header or name. By the time your program reaches the save-command your recorder should be in 'RECORD' mode. This program saves only the pattern-generation tables and not the colour tables.

Of course you want to load a screen back into the MTX so you also need:

```
10 CODE
```

```

8007      LD HL,£0000
800A      LD A,L

```

```

800B      OUT (£02),A
800D      LD A,H
800E      OUT (£02),A

```

8010	LD C,£18	8027	RET
8012	LD B,£00	8028 SAVE:	XOR A
8014 LOOP:	PUSH BC	8029	LD (£FD68),A
8015	LD HL,BUFFER	802C	CALL £0BEF
8018 INNER:	IN A, (£01)	802F	LD HL,BUFFER
801A	LD (HL),A	8032	LD DE,£0100
801B	INC HL	8035	CALL £0AAE
801C	DJNZ INNER	8038	LD DE,£0000
801E	CALL SAVE	803B WAIT:	DEC DE
8021	POP BC	803C	LD A,D
8022	DEC C	803D	OR E
8023	LD A,C	803E	JR NZ, WAIT
8024	OR A	8040	RET
8025	JR NZ, LOOP	8041 BUFFER:	DS 200
		8109	DS 56

Did you discover the blooper also? The latter routine is the SAVE routine and the first is the LOAD routine. I'm sorry! These things happen from time to time.

And for the games enthusiasts, a listing of the game OBSTACLE. This game has been published in an infinite number of books, magazines etc. But mine comes from a friend who possesses a TRS-80. I played the game quite a number of times and won most often despite of his innumerable cheat-keys! To make a short story a little longer; this game is dedicated to Mr P.M. Nieuwdorp. I adapted the game for the MTX for one reason only: to test whether or not graphic characters could be read using SPK\$ for collision testing. The game is for by 2 players. May you have as much fun and laughter as I did.

## NEW GAMES FROM INFOCOM

### Enchanter

### Ballyhoo

**W**elcome us...  
The Circle of Enchanters/  
have foreseen that a ruthless and  
powerful evil may one day  
seize this land. Should that time  
arrive we also foresee the coming  
of one of a young Enchanter/  
one whose heart and will may  
triumph over the wicked's dom-  
ineering. It is our hope that  
Enchanter hears our words.  
We see your face through  
time but this we know  
are promising in  
not gained...

## Newword Tips by B. Houghton

As most readers will know, Newword has a number of undocumented commands, and several others which are poorly described. The .X commands have been thoroughly aired in MEMOPAD, but the following ones may be less familiar:

~QE :cursor to left of top line on screen;  
 ~QX :cursor to end of bottom screen line;  
 (these are useful for setting block markers)

NEWWORD Do-it-Yourself says (once) that there are several print drivers available, but it doesn't tell you how to use them. This is a pity, as the disc output driver can save you miles of paper if you are as sloppy a typist as I am, and the command syntax is quite unlike the Wordstar equivalent and not at all obvious unless you know what you are looking for. To use it, do as follows:

1. From the opening menu, select 'P' or 'M'
2. Enter an appropriate filename
3. Answer ALL of the prompts (<RET> for defaults): do NOT TYPE <ESC> TO END THE PROMPT SEQUENCE. There will be a pause as the NWPRINT overlay loads.
4. In response to 'Name of printer?' type PRVIEW (yes! - not prEview)

You will get the usual screen messages, but it is the disc-drive rather than the printer which will operate.

You will be left with an extra file called PREVIEW.NW which is a simulation of your hard-copy output with all of the non-display features you may have chosen such as headers, footers, offsets and any of the Mailmerge commands which you have set up.

^R (F7) normally scrolls the screen up by one screen window, but given in response to a screen question it recalls the last response to a similar question. ^R is described as 'RECALL' in some help messages, but not in the user guide.

It is quite useful to make a list of the few major differences between Newword and Wordstar. Information about Newword is limited to the rather unsystematic and poorly-indexed user guide and the expensive Newword Encyclopedia, but Wordstar must be one of the most thoroughly documented applications programs which have ever been written, and most of this information is equally applicable to Newword. ★

## Anagram by T. Hallam

```
5 PRINT CHR$(28)
10 DIM D(30)
20 PRINT : INPUT "ENTER WORD ";A$: LET L
=LEN (A$): LET X=L: IF X>30 THEN GOTO 2
0 ELSE GOSUB 30: GOTO 20
30 LET D(X)=X
40 IF X>2 THEN LET X=X-1: GOSUB 30
50 IF X=2 THEN PRINT A$;
60 LET A$=A$(X)+A$(1,X-1)+A$(X+1,L-X)
70 LET D(X)=D(X)-1: IF D(X)>0 THEN GOTO
40
80 LET X=X+1: RETURN
```

The listing above is a recursive program that prints all combinations of the word entered.

The maximum number of characters is 30, but as 7 characters has five thousand combinations and takes six minutes to list words longer than this seem never ending.

The listing below is the same program with lines thirty to eighty in machine code, which reduces the time taken by 80%.

The comments refer to the BASIC line numbers the code replaces.
